

FEATURES

- ▶ Reinforced Insulation rated for 300VAC Working Voltage
- ▶ I/O-isolation Voltage 4000VACrms
- ▶ Industrial & Medical Safety Approval
- ▶ Ultra-wide Input Voltage Ranges:
9-40VDC, 18-80VDC and 36-160VDC
- ▶ Fully regulated Output Voltage
- ▶ Low Leakage Current
- ▶ Operating Temp. Range -40°C to +85 °C
- ▶ Input Filter meets EN 55022, class A
- ▶ Short Circuit Protection
- ▶ 3 Years Product Warranty

PRODUCT OVERVIEW

The MINMAX MIHW2000 series is a range of high performance DC/DC converter modules with a reinforced insulation system. The I/O- isolation voltage is specified for 4000VACrms. The product comes in a small DIP-24 package. All models features an ultra-wide input voltage range including 36-160VDC for railroad applications.

Full SMD design with exclusive use of ceramic capacitors guarantees a high reliability with calculated MTBF of >1 Mio. hours.

These high isolation DC/DC converters are the perfect solution solution for many demanding applications in industrial and railroad systems, in medical instrumentation, everywhere where a certified supplementary or reinforced insulation system is required to comply with specific industrial or medical safety standards.

Notes

- 1 Specifications typical at $T_a = +25^{\circ}\text{C}$, resistive load, nominal input voltage and rated output current unless otherwise noted.
- 2 Transient recovery time is measured to within 1% error band for a step change in output load of 75% to 100%.
- 3 Ripple & Noise measurement bandwidth is 0-20 MHz.
- 4 These power converters require a minimum output loading to maintain specified regulation, operation under no-load conditions will not damage these modules; however, they may not meet all specifications listed.
- 5 All DC/DC converters should be externally fused at the front end for protection.
- 6 Other input and output voltage may be available, please contact factory.
- 7 Specifications subject to change without notice.

Test Configurations

Input Reflected-Ripple Current Test Setup

Input reflected-ripple current is measured with an inductor L_{in} (4.7 μ H) and C_{in} (220 μ F, ESR < 1.0 Ω at 100 KHz) to simulate source impedance. Capacitor C_{in} offsets possible battery impedance. Current ripple is measured at the input terminals of the module, measurement bandwidth is 0-500 KHz.

Peak-to-Peak Output Noise Measurement Test

Use a C_{out} 0.47 μ F ceramic capacitor. Scope measurement should be made by using a BNC socket, measurement bandwidth is 0-20 MHz. Position the load between 50 mm and 75 mm from the DC/DC Converter.

Design & Feature Considerations

Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. The unit operates normally once the output current is brought back into its specified range.

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor on the input to insure startup. By using a good quality low Equivalent Series Resistance (ESR < 1.0 Ω at 100 kHz) capacitor of a 4.7 μ F for the 24V input devices, a 2.2 μ F for the 48V devices and a 1 μ F for the 110V devices, capacitor mounted close to the power module helps ensure stability of the unit.

Output Ripple Reduction

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance. To reduce output ripple, it is recommended to use 3.3 μ F capacitors at the output.

Maximum Capacitive Load

The MIHW2000 series has limitation of maximum connected capacitance on the output. The power module may operate in current limiting mode during start-up, affecting the ramp-up and the startup time. Connect capacitors at the point of load for best performance. The maximum capacitance can be found in the data sheet.

Thermal Considerations

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below 95°C. The derating curves are determined from measurements obtained in a test setup.
