

## 2G bits DDR3L SDRAM

### EDJ2108EEBG (256M words × 8 bits) EDJ2116EEBG (128M words × 16 bits)

#### Specifications

- Density: 2G bits
- Organization
  - 32M words × 8 bits × 8 banks (EDJ2108EEBG)
  - 16M words × 16 bits × 8 banks (EDJ2116EEBG)
- Package
  - 78-ball FBGA (EDJ2108EEBG)
  - 96-ball FBGA (EDJ2116EEBG)
- Lead-free (RoHS compliant) and Halogen-free
- Power supply: 1.35V (typ)
  - VDD = 1.283V to 1.45V
  - Backward compatible for VDD, VDDQ = 1.5V ± 0.075V
- Data rate
  - 1866Mbps/1600Mbps/1333Mbps (max)
- 1KB page size (EDJ2108EEBG)
  - Row address: A0 to A14
  - Column address: A0 to A9
- 2KB page size (EDJ2116EEBG)
  - Row address: A0 to A13
  - Column address: A0 to A9
- Eight internal banks for concurrent operation
- Burst length (BL): 8 and 4 with Burst Chop (BC)
- Burst type (BT):
  - Sequential (8, 4 with BC)
  - Interleave (8, 4 with BC)
- /CAS Latency (CL): 5, 6, 7, 8, 9, 10, 11, 13
- /CAS Write Latency (CWL): 5, 6, 7, 8, 9
- Precharge: auto precharge option for each burst access
- Driver strength: RZQ/7, RZQ/6 (RZQ = 240Ω)
- Refresh: auto-refresh, self-refresh
- Refresh cycles
  - Average refresh period
    - 7.8μs at 0°C ≤ TC ≤ +85°C
    - 3.9μs at +85°C < TC ≤ +95°C
- Operating case temperature range
  - TC = 0°C to +95°C

#### Features

- Double-data-rate architecture: two data transfers per clock cycle
- The high-speed data transfer is realized by the 8 bits prefetch pipelined architecture
- Bi-directional differential data strobe (DQS and /DQS) is transmitted/received with data for capturing data at the receiver
- DQS is edge-aligned with data for READs; center-aligned with data for WRITEs
- Differential clock inputs (CK and /CK)
- DLL aligns DQ and DQS transitions with CK transitions
- Commands entered on each positive CK edge; data and data mask referenced to both edges of DQS
- Data mask (DM) for write data
- Posted /CAS by programmable additive latency for better command and data bus efficiency
- On-Die Termination (ODT) for better signal quality
  - Synchronous ODT
  - Dynamic ODT
  - Asynchronous ODT
- Multi Purpose Register (MPR) for pre-defined pattern read out
- ZQ calibration for DQ drive and ODT
- /RESET pin for Power-up sequence and reset function
- SRT range:
  - Normal/extended
- Programmable Output driver impedance control
- Seamless BL4 access with bank-grouping
  - Applied only for DDR3-1333 and 1600

## Ordering Information

## 1. Electrical Conditions

- All voltages are referenced to VSS (GND)
- Execute power-up and Initialization sequence before proper device operation is achieved.

### 1.1 Absolute Maximum Ratings

**Table 1: Absolute Maximum Ratings**

| Parameter                       | Symbol | Rating                    | Unit | Notes |
|---------------------------------|--------|---------------------------|------|-------|
| Power supply voltage            | VDD    | -0.4 to +1.975            | V    | 1, 3  |
| Power supply voltage for output | VDDQ   | -0.4 to +1.975            | V    | 1, 3  |
| Input voltage                   | VIN    | -0.4 to +1.975            | V    | 1     |
| Output voltage                  | VOUT   | -0.4 to +1.975            | V    | 1     |
| Reference voltage               | VREFCA | -0.4 to $0.6 \times VDD$  | V    | 3     |
| Reference voltage for DQ        | VREFDQ | -0.4 to $0.6 \times VDDQ$ | V    | 3     |
| Storage temperature             | Tstg   | -55 to +100               | °C   | 1, 2  |
| Power dissipation               | PD     | 1.0                       | W    | 1     |
| Short circuit output current    | IOUT   | 50                        | mA   | 1     |

- Notes: 1. Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage temperature is the case surface temperature on the center/top side of the DRAM.
3. VDD and VDDQ must be within 300mV of each other at all times; and VREF must be no greater than  $0.6 \times VDDQ$ . When VDD and VDDQ are less than 500mV; VREF may be equal to or less than 300mV.

**Caution: Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.**

### 1.2 Operating Temperature Condition

**Table 2: Operating Temperature Condition**

| Parameter                  | Symbol | Rating   | Unit | Notes   |
|----------------------------|--------|----------|------|---------|
| Operating case temperature | TC     | 0 to +95 | °C   | 1, 2, 3 |

- Notes: 1. Operating temperature is the case surface temperature on the center/top side of the DRAM.
2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0°C to +85°C under all operating conditions.
3. Some applications require operation of the DRAM in the Extended Temperature Range between +85°C and +95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
- a) Refresh commands must be doubled in frequency, therefore reducing the refresh interval tREFI to 3.9μs. (This double refresh requirement may not apply for some devices.)
- b) If Self-refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 bit [A6, A7] = [0, 1]) or enable the optional Auto Self-Refresh mode (MR2 bit [A6, A7] = [1, 0]).

1.3 Recommended DC Operating Conditions

Table 3: Recommended DC Operating Conditions (TC = 0°C to +85°C), DDR3L Operation

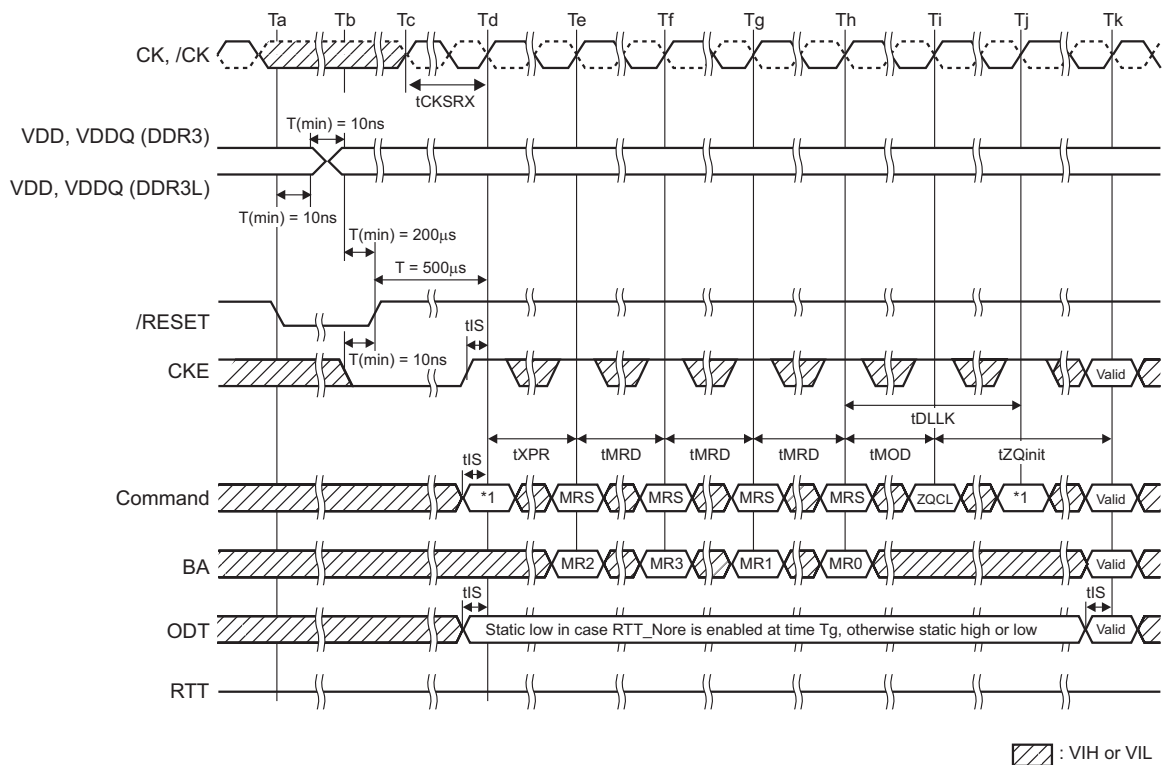

| Parameter             | Symbol | min.  | typ. | max. | Unit | Notes      |
|-----------------------|--------|-------|------|------|------|------------|
| Supply voltage        | VDD    | 1.283 | 1.35 | 1.45 | V    | 1, 2, 3, 4 |
| Supply voltage for DQ | VDDQ   | 1.283 | 1.35 | 1.45 | V    | 1, 2, 3, 4 |

- Notes: 1. Maximum DC value may not be greater than 1.425V. The DC value is the linear average of VDD/VDDQ(t) over a very long period of time (e.g. 1 sec).  
 2. If maximum limit is exceeded, input levels shall be governed by DDR3 specifications.  
 3. Under these supply voltages, the device operates to this DDR3L specification.  
 4. Once initialized for DDR3L operation, DDR3 operation may only be used if the device is in reset while  
 5. VDD and VDDQ are changed for DDR3 operation shown as following timing wave form.

Table 4: Recommended DC Operating Conditions (TC = 0°C to +85°C), DDR3 Operation

| Parameter             | Symbol | min   | typ | max   | Unit | Notes   |
|-----------------------|--------|-------|-----|-------|------|---------|
| Supply voltage        | VDD    | 1.425 | 1.5 | 1.575 | V    | 1, 2, 3 |
| Supply voltage for DQ | VDDQ   | 1.425 | 1.5 | 1.575 | V    | 1, 2, 3 |

- Notes: 1. If minimum limit is exceeded, input levels shall be governed by DDR3L specifications.  
 2. Under 1.5V operation, this DDR3L device operates to the DDR3 specifications under the same speedtimings as defined for this device.  
 3. Once initialized for DDR3 operation, DDR3L operation may only be used if the device is in reset while VDD and VDDQ are changed for DDR3L operation shown as below.

Note: 1. From time point Td until Tk, NOP or DES commands must be applied between MRS and ZQCL commands.

Figure 1: VDD/VDDQ Voltage Switch between DDR3L and DDR3

## 1.4 IDD and IDDQ Measurement Conditions

In this chapter, IDD and IDDQ measurement conditions such as test load and patterns are defined.

The figure Measurement Setup and Test Load for IDD and IDDQ Measurements shows the setup and test load for IDD and IDDQ measurements.

- IDD currents (such as IDD0, IDD1, IDD2N, IDD2NT, IDD2P0, IDD2P1, IDD2Q, IDD3N, IDD3P, IDD4R, IDD4W, IDD5B, IDD6, IDD6ET, IDD6TC and IDD7) are measured as time-averaged currents with all VDD balls of the DDR3 SDRAM under test tied together. Any IDDQ current is not included in IDD currents.
- IDDQ currents (such as IDDQ2NT and IDDQ4R) are measured as time-averaged currents with all VDDQ balls of the DDR3 SDRAM under test tied together. Any IDD current is not included in IDDQ currents.

Note:IDDQ values cannot be directly used to calculate I/O power of the DDR3 SDRAM. They can be used to support correlation of simulated I/O power to actual I/O power as outlined in correlation from simulated channel I/O power to actual channel I/O power supported by IDDQ measurement.

For IDD and IDDQ measurements, the following definitions apply:

- L and 0:  $V_{IN} \leq V_{IL(AC)max}$
- H and 1:  $V_{IN} \geq V_{IH(AC)min}$
- MID-LEVEL: defined as inputs are  $V_{REF} = V_{DDQ} / 2$
- FLOATING: don't care or floating around  $V_{REF}$ .
- Timings used for IDD and IDDQ measurement-loop patterns are provided in Timings used for IDD and IDDQ Measurement-Loop Patterns table.
- Basic IDD and IDDQ measurement conditions are described in Basic IDD and IDDQ Measurement Conditions table.

Note:The IDD and IDDQ measurement-loop patterns need to be executed at least one time before actual IDD or IDDQ measurement is started.

- Detailed IDD and IDDQ measurement-loop patterns are described in IDD0 Measurement-Loop Pattern table through IDD7 Measurement-Loop Pattern table.
- IDD Measurements are done after properly initializing the DDR3 SDRAM. This includes but is not limited to setting.
  - RON = RZQ/7 (34Ω in MR1);
  - Qoff = 0B (Output Buffer enabled in MR1);
  - RTT\_Nom = RZQ/6 (40Ω in MR1);
  - RTT\_WR = RZQ/2 (120Ω in MR2);
  - TDQS Feature disabled in MR1
- Define D = {/CS, /RAS, /CAS, /WE} : = {H, L, L, L}
- Define /D = {/CS, /RAS, /CAS, /WE} : = {H, H, H, H}

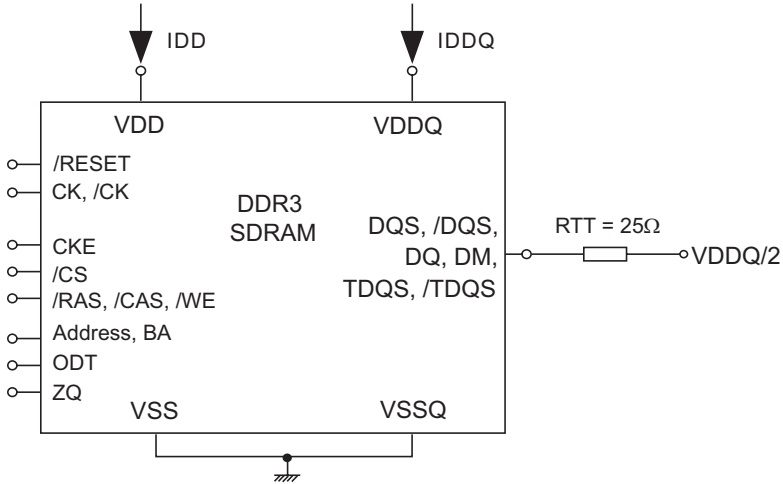

Figure 2: Measurement Setup and Test Load for IDD and IDDQ Measurements

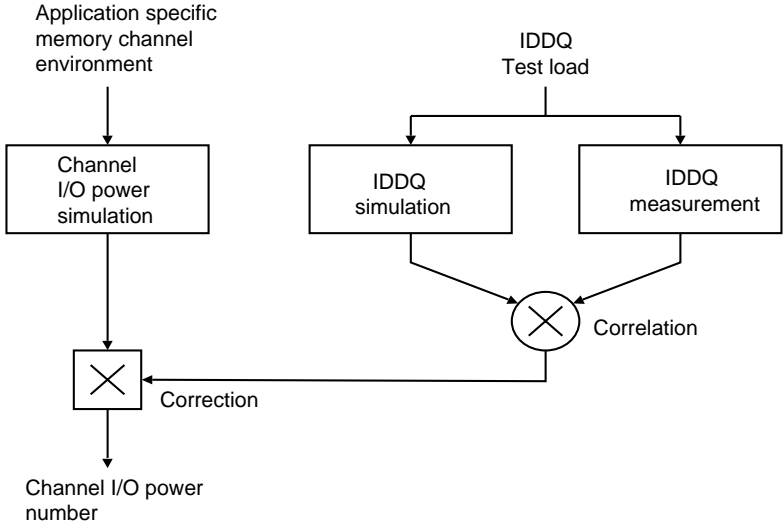

Figure 3: Correlation from Simulated Channel I/O Power to Actual Channel I/O Power Supported by IDDQ Measurement

## 1.4.1 Timings Used for IDD and IDDQ Measurement-Loop Patterns

Table 5: Timings Used for IDD and IDDQ Measurement-Loop Patterns

| Parameter       | DDR3-800 | DDR3-1066 | DDR3-1333 | DDR3-1600 | Unit |
|-----------------|----------|-----------|-----------|-----------|------|
|                 | 6-6-6    | 7-7-7     | 9-9-9     | 11-11-11  |      |
| CL              | 6        | 7         | 9         | 11        | nCK  |
| tCK(min)        | 2.5      | 1.875     | 1.5       | 1.25      | ns   |
| nRCD(min)       | 6        | 7         | 9         | 11        | nCK  |
| nRC(min)        | 21       | 27        | 33        | 39        | nCK  |

## 1.4.2 Basic IDD and IDDQ Measurement Conditions

Table 6: Basic IDD and IDDQ Measurement Conditions

| Parameter  | Symbol  | Description  |
|--|---------|--|
| Operating one bank active precharge current      | IDD0    | CKE: H; External clock: on; tCK, nRC, nRAS, CL: see Table 5; BL: 8*1; AL: 0; /CS: H between ACT and PRE; Command, address, bank address inputs: partially toggling according to Table 7; Data I/O: MID-LEVEL; DM: stable at 0; Bank activity: cycling with one bank active at a time: 0,0,1,1,2,2,... (see Table 7); Output buffer and RTT: enabled in MR*2; ODT signal: stable at 0; Pattern details: see Table 7   |
| Operating one bank active-read-precharge current | IDD1    | CKE: H; External clock: On; tCK, nRC, nRAS, nRCD, CL: see Table 5; BL: 8*1, *6; AL: 0; /CS: H between ACT, RD and PRE; Command, address, bank address inputs, data I/O: partially toggling according to Table 8; DM: stable at 0; Bank activity: cycling with one bank active at a time: 0,0,1,1,2,2,... (see Table 8); Output buffer and RTT: enabled in MR*2; ODT Signal: stable at 0; Pattern details: see Table 8  |
| Precharge standby current                        | IDD2N   | CKE: H; External clock: on; tCK, CL: see Table 5 BL: 8*1; AL: 0; /CS: stable at 1; Command, address, bank address Inputs: partially toggling according to Table 9; data I/O: MID-LEVEL; DM: stable at 0; bank activity: all banks closed; output buffer and RTT: enabled in mode registers*2; ODT signal: stable at 0; pattern details: see Table 9  |
| Precharge standby ODT current                    | IDD2NT  | CKE: H; External clock: on; tCK, CL: see Table 5; BL: 8*1; AL: 0; /CS: stable at 1; Command, address, bank address Inputs: partially toggling according to Table 10; data I/O: MID-LEVEL; DM: stable at 0; bank activity: all banks closed; output buffer and RTT: enabled in MR*2; ODT signal: toggling according to Table 10; pattern details: see Table 10  |
| Precharge standby ODT IDDQ current               | IDDQ2NT | Same definition like for IDD2NT, however measuring IDDQ current instead of IDD current   |
| Precharge power-down current slow exit           | IDD2P0  | CKE: L; External clock: on; tCK, CL: see Table 5; BL: 8*1; AL: 0; /CS: stable at 1; Command, address, bank address inputs: stable at 0; data I/O: MID-LEVEL; DM: stable at 0; bank activity: all banks closed; output buffer and RTT: EMR*2; ODT signal: stable at 0; precharge power down mode: slow exit*3   |
| Precharge power-down current fast exit           | IDD2P1  | CKE: L; External clock: on; tCK, CL: see Table 6; BL: 8*1; AL: 0; /CS: stable at 1; Command, address, bank address Inputs: stable at 0; data I/O: MID-LEVEL; DM: stable at 0; bank activity: all banks closed; output buffer and RTT: enabled in MR*2; ODT signal: stable at 0; precharge power down mode: fast exit*3   |
| Precharge quiet standby current                  | IDD2Q   | CKE: H; External clock: On; tCK, CL: see Table 5; BL: 8*1; AL: 0; /CS: stable at 1; Command, address, bank address Inputs: stable at 0; data I/O: MID-LEVEL; DM: stable at 0; bank activity: all banks closed; output buffer and RTT: enabled in MR*2; ODT signal: stable at 0   |
| Active standby current                           | IDD3N   | CKE: H; External clock: on; tCK, CL: see Table 5; BL: 8*1; AL: 0; /CS: stable at 1; Command, address, bank address Inputs: partially toggling according to Table 9; data I/O: MID-LEVEL; DM: stable at 0; bank activity: all banks open; output buffer and RTT: enabled in MR*2; ODT signal: stable at 0; pattern details: see Table 9   |
| Active power-down current                        | IDD3P   | CKE: L; External clock: on; tCK, CL: see Table 5; BL: 8*1; AL: 0; /CS: stable at 1; Command, address, bank address inputs: stable at 0; data I/O: MID-LEVEL; DM: stable at 0; bank activity: all banks open; output buffer and RTT: enabled in MR*2; ODT signal: stable at 0   |
| Operating burst read current                     | IDD4R   | CKE: H; External clock: on; tCK, CL: see Table 5; BL: 8*1, *6; AL: 0; /CS: H between RD; Command, address, bank address Inputs: partially toggling according to Table 11; data I/O: seamless read data burst with different data between one burst and the next one according to Table 11; DM: stable at 0; bank activity: all banks open, RD commands cycling through banks: 0,0,1,1,2,2,... (see Table 11); Output buffer and RTT: enabled in MR*2; ODT signal: stable at 0; pattern details: see Table 11 |
| Operating burst read IDDQ current                | IDDQ4R  | Same definition like for IDD4R, however measuring IDDQ current instead of IDD current  |

Table 6: Basic IDD and IDDQ Measurement Conditions (cont'd)

| Parameter  | Symbol | Description   |
|--|--------|---|
| Operating burst write current                    | IDD4W  | CKE: H; External clock: on; tCK, CL: see <a href="#">Table 5</a> ; BL: 8* <sup>1</sup> ; AL: 0; /CS: H between WR; command, address, bank address inputs: partially toggling according to <a href="#">Table 12</a> ; data I/O: seamless write data burst with different data between one burst and the next one according to IDD4W Measurement-Loop Pattern table; DM: stable at 0; bank activity: all banks open, WR commands cycling through banks: 0,0,1,1,2,2,.. (see <a href="#">Table 12</a> ); Output buffer and RTT: enabled in MR* <sup>2</sup> ; ODT signal: stable at H; pattern details: see <a href="#">Table 12</a>   |
| Burst refresh current                            | IDD5B  | CKE: H; External clock: on; tCK, CL, nRFC: see <a href="#">Table 5</a> ; BL: 8* <sup>1</sup> ; AL: 0; /CS: H between REF; Command, address, bank address Inputs: partially toggling according to <a href="#">Table 13</a> ; data I/O: MID-LEVEL; DM: stable at 0; bank activity: REF command every nRFC ( <a href="#">Table 13</a> ); output buffer and RTT: enabled in MR* <sup>2</sup> ; ODT signal: stable at 0; pattern details: see <a href="#">Table 13</a>   |
| Self-refresh current: normal temperature range   | IDD6   | TC: 0 to 85°C; ASR: disabled* <sup>4</sup> ; SRT: Normal* <sup>5</sup> ; CKE: L; External clock: off; CK and /CK: L; CL: see <a href="#">Table 5</a> ; BL: 8* <sup>1</sup> ; AL: 0; /CS, command, address, bank address, data I/O: MID-LEVEL; DM: stable at 0; bank activity: Self-refresh operation; output buffer and RTT: enabled in MR* <sup>2</sup> ; ODT signal: MID-LEVEL  |
| Self-refresh current: extended temperature range | IDD6ET | TC: 0 to 95°C; ASR: Disabled* <sup>4</sup> ; SRT: Extended* <sup>5</sup> ; CKE: L; External clock: off; CK and /CK: L; CL: <a href="#">Table 5</a> ; BL: 8* <sup>1</sup> ; AL: 0; /CS, command, address, bank address, data I/O: MID-LEVEL; DM: stable at 0; bank activity: Extended temperature self-refresh operation; output buffer and RTT: enabled in MR* <sup>2</sup> ; ODT signal: MID-LEVEL   |
| Auto self-refresh current (Optional)             | IDD6TC | TC: 0 to 95°C; ASR: Enabled* <sup>4</sup> ; SRT: Normal* <sup>5</sup> ; CKE: L; External clock: off; CK and /CK: L; CL: <a href="#">Table 5</a> ; BL: 8* <sup>1</sup> ; AL: 0; /CS, command, address, bank address, data I/O: MID-LEVEL; DM: stable at 0; bank activity: Auto self-refresh operation; output buffer and RTT: enabled in MR* <sup>2</sup> ; ODT signal: MID-LEVEL  |
| Operating bank interleave read current           | IDD7   | CKE: H; External clock: on; tCK, nRC, nRAS, nRCD, nRRD, nFAW, CL: see <a href="#">Table 5</a> ; BL: 8* <sup>1</sup> , * <sup>6</sup> ; AL: CL-1; /CS: H between ACT and RDA; Command, address, bank address Inputs: partially toggling according to <a href="#">Table 14</a> ; data I/O: read data bursts with different data between one burst and the next one according to <a href="#">Table 14</a> ; DM: stable at 0; bank activity: two times interleaved cycling through banks (0, 1, ...7) with different addressing, see <a href="#">Table 14</a> ; output buffer and RTT: enabled in MR* <sup>2</sup> ; ODT signal: stable at 0; pattern details: see <a href="#">Table 14</a> |
| RESET low current                                | IDD8   | /RESET: low; External clock: off; CK and /CK: low; CKE: FLOATING; /CS, command, address, bank address, Data IO: FLOATING; ODT signal: FLOATING<br>RESET low current reading is valid once power is stable and /RESET has been low for at least 1ms.   |

- Notes: 1. Burst Length: BL8 fixed by MRS: MR0 bits [1,0] = [0,0].  
2. MR: Mode Register  
Output buffer enable: set MR1 bit A12 = 1 and MR1 bits [5, 1] = [0,1];  
RTT\_Nom enable: set MR1 bits [9, 6, 2] = [0, 1, 1]; RTT\_WR enable: set MR2 bits [10, 9] = [1,0].  
3. Precharge power down mode: set MR0 bit A12= 0 for Slow Exit or MR0 bit A12 = 1 for fast exit.  
4. Auto self-refresh (ASR): set MR2 bit A6 = 0 to disable or 1 to enable feature.  
5. Self-refresh temperature range (SRT): set MR0 bit A7= 0 for normal or 1 for extended temperature range.  
6. Read burst type: nibble sequential, set MR0 bit A3 = 0

- Notes: 1. DM must be driven low all the time. DQS, /DQS are used according to read commands, otherwise MID-LEVEL.  
2. Burst sequence driven on each DQ signal by read command. Outside burst operation, DQ signals are MID-LEVEL.  
3. BA: BA0 to BA2.  
4. Am: m means Most Significant Bit (MSB) of Row address.

- Notes: 1. DM must be driven low all the time. DQS, /DQS are used according to read commands, otherwise MID-LEVEL.  
 2. Burst sequence driven on each DQ signal by read command. Outside burst operation, DQ signals are MID-LEVEL.  
 3. BA: BA0 to BA2.  
 4. Am: m means Most Significant Bit (MSB) of Row address.

## 2. Electrical Specifications

**Table 18: Pin Capacitance [DDR3-1866 to 2133] (TC = 25°C, VDD, VDDQ = 1.283V to 1.45V)**

| Parameter   | Symbol      | DDR3L-1866 |      | Units | Notes   |
|---|-------------|------------|------|-------|---------|
|   |             | Min        | Max  |       |         |
| Input/output capacitance  | CIO         | 1.4        | 2.1  | pF    | 1, 2    |
| Input capacitance, CK and /CK                                   | CCK         | 0.8        | 1.3  | pF    | 2       |
| Input capacitance delta, CK and /CK                             | CDCK        | 0          | 0.15 | pF    | 2, 3    |
| Input/output capacitance delta, DQS and /DQS                    | CDDQS       | 0          | 0.15 | pF    | 2, 4    |
| Input capacitance, (control, address, command, input-only pins) | CI          | 0.75       | 1.2  | pF    | 2, 5    |
| Input capacitance delta, (All control input-only pins)          | CDI_CTRL    | -0.4       | 0.2  | pF    | 2, 6, 7 |
| Input capacitance delta, (All address/command input-only pins)  | CDI_ADD_CMD | -0.4       | 0.4  | pF    | 2, 8, 9 |
| Input/output capacitance delta, DQ,DM, DQS, /DQS, TDQS, /TDQS   | CDIO        | -0.5       | 0.3  | pF    | 2, 10   |
| Input/output capacitance of ZQ pin                              | CZQ         | —          | 3    | pF    | 2, 11   |

- Notes:
1. Although the DM, TDQS and /TDQS pins have different functions, the loading matches DQ and DQS.
  2. VDD, VDDQ, VSS, VSSQ applied and all other pins floating (except the pin under test, CKE, /RESET and ODT as necessary). VDD = VDDQ = 1.35V, VBIAS=VDD/2 and ondie termination off.
  3. Absolute value of CCK-C/CK.
  4. Absolute value of CIO(DQS)-CIO(/DQS).
  5. CI applies to ODT, /CS, CKE, A0-A15, BA0-BA2, /RAS, /CAS and /WE.
  6. CDI\_CTRL applies to ODT, /CS and CKE.
  7.  $CDI\_CTRL = CI(CTRL) - 0.5 \times (CI(CK)+CI(/CK))$ .
  8. CDI\_ADD\_CMD applies to A0-A15, BA0-BA2, /RAS, /CAS and /WE.
  9.  $CDI\_ADD\_CMD = CI(ADD\_CMD) - 0.5 \times (CI(CK)+CI(/CK))$ .
  10.  $CDIO=CIO(DQ,DM) - 0.5 \times (CIO(DQS)+CIO(/DQS))$ .
  11. Maximum external load capacitance on ZQ pin: 5pF.

## 2.3 Standard Speed Bins

| tCK(avg) @CL=13        | CWL = 5, 6, 7, 8   | Reserved                  | Reserved  | ns   | 4          |  |
|                        | CWL = 9            | 1.07                      | 1.25      | ns   | 4          |  |
| Supported CL settings  |                    | 5, 6, 7, 8, 9, 10, 11, 13 |           | nCK  | 1, 2, 3, 8 |  |
| Supported CWL settings |                    | 5, 6, 7, 8, 9             |           | nCK  |            |  |

- Notes:
1. The CL setting and CWL setting result in tCK(avg)min and tCK(avg)max requirements. When making a selection of tCK(avg), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
  2. tCK(avg)min limits: Since /CAS latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(avg) value (3.0, 2.5, 1.875, 1.5, or 1.25ns) when calculating  $CL(nCK) = tAA(ns) / tCK(avg)(ns)$ , rounding up to the next 'Supported CL'.
  3. tCK(avg)max limits: Calculate  $tCK(avg) + tAA(max)/CL$  selected and round the resulting tCK(avg) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875ns or 1.25ns). This result is tCK(avg)max corresponding to CL selected.
  4. Reserved' settings are not allowed. User must program a different value.
  5. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table DDR3-1066 Speed Bins which are not subject to production tests but verified by design/characterization.
  6. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table DDR3-1333 Speed Bins which is not subject to production tests but verified by design/characterization.
  7. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table DDR3-1600 Speed Bins which is not subject to production tests but verified by design/characterization.
  8. Any DDR3-1866 speed bin also supports functional operation at lower frequencies as shown in the table DDR3-1866 Speed Bins which is not subject to production tests but verified by design/characterization.
  9. tREFI depends on operating case temperature (TC).
  10. For devices supporting optional down binning to CL = 7 and CL = 9, tAA/tRCD/tRP(min) must be 13.125 ns or lower. SPD settings must be programmed to match.
  11. DDR3-800 AC timing apply if DRAM operates at lower than 800 MT/s data rate.

3. Package Drawing

3.1 78-ball FBGA

Solder ball: Lead free (Sn-Ag-Cu)

Unit: mm

ECA-TS2-0381-01

3.2 96-ball FBGA

Solder ball: Lead free (Sn-Ag-Cu)

Unit: mm

ECA-TS2-0382-01

#### **4. Recommended Soldering Conditions**

Please consult with our sales offices for soldering conditions of the 2G bits DDR3 SDRAM.

##### **Type of Surface Mount Device**

EDJ2108EEBG: 78-ball FBGA < Lead free (Sn-Ag-Cu) >

EDJ2116EEBG: 96-ball FBGA < Lead free (Sn-Ag-Cu) >

**NOTES FOR CMOS DEVICES****① PRECAUTION AGAINST ESD FOR MOS DEVICES**

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

**② HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES**

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

**③ STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.

The information in this document is subject to change without notice. Before using this document, confirm that this is the latest version.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of Elpida Memory, Inc.

Elpida Memory, Inc. does not assume any liability for infringement of any intellectual property rights (including but not limited to patents, copyrights, and circuit layout licenses) of Elpida Memory, Inc. or third parties by or arising from the use of the products or information listed in this document. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of Elpida Memory, Inc. or others.

Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of the customer's equipment shall be done under the full responsibility of the customer. Elpida Memory, Inc. assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

**[Product applications]**

Be aware that this product is for use in typical electronic equipment for general-purpose applications. Elpida Memory, Inc. makes every attempt to ensure that its products are of high quality and reliability. However, this product is not intended for use in the product in aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment, medical equipment for life support, or other such application in which especially high quality and reliability is demanded or where its failure or malfunction may directly threaten human life or cause risk of bodily injury. Customers are instructed to contact Elpida Memory's sales office before using this product for such applications.

**[Product usage]**

Design your application so that the product is used within the ranges and conditions guaranteed by Elpida Memory, Inc., including the maximum ratings, operating supply voltage range, heat radiation characteristics, installation conditions and other related characteristics. Elpida Memory, Inc. bears no responsibility for failure or damage when the product is used beyond the guaranteed ranges and conditions. Even within the guaranteed ranges and conditions, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Elpida Memory, Inc. products does not cause bodily injury, fire or other consequential damage due to the operation of the Elpida Memory, Inc. product.

**[Usage environment]**

Usage in environments with special characteristics as listed below was not considered in the design. Accordingly, our company assumes no responsibility for loss of a customer or a third party when used in environments with the special characteristics listed below.

Example:

- 1) Usage in liquids, including water, oils, chemicals and organic solvents.
- 2) Usage in exposure to direct sunlight or the outdoors, or in dusty places.
- 3) Usage involving exposure to significant amounts of corrosive gas, including sea air, CL<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>x</sub>.
- 4) Usage in environments with static electricity, or strong electromagnetic waves or radiation.
- 5) Usage in places where dew forms.
- 6) Usage in environments with mechanical vibration, impact, or stress.
- 7) Usage near heating elements, igniters, or flammable items.

If you export the products or technology described in this document that are controlled by the Foreign Exchange and Foreign Trade Law of Japan, you must follow the necessary procedures in accordance with the relevant laws and regulations of Japan. Also, if you export products/technology controlled by U.S. export control regulations, or another country's export control laws or regulations, you must follow the necessary procedures in accordance with such laws or regulations.

If these products/technology are sold, leased, or transferred to a third party, or a third party is granted license to use these products, that third party must be made aware that they are responsible for compliance with the relevant laws and regulations.
