

AZP63

Low Phase Noise Sine Wave/CMOS to LVPECL Buffer/Divider

www.azmicrotek.com

FEATURES

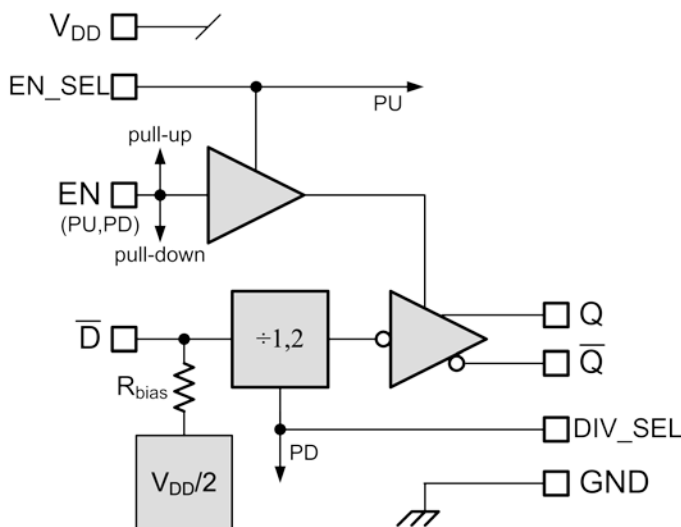

- LVPECL outputs optimized for very low phase noise (-165dBc/Hz)
- High bandwidth, > 1GHz
- Selectable $\div 1$, $\div 2$ output
- Selectable Enable logic
- 3.0V to 3.6V operation

DESCRIPTION

The AZP63 is a sine wave/CMOS to LVPECL buffer/divider optimized for very low phase noise (-165dBc/Hz). It is particularly useful in converting crystal or SAW based oscillators into LVPECL outputs for greater than 1GHz of bandwidth. For lower power consumption and reduced bandwidth, refer to the [AZP5x](#) family.

The [AZP63](#) is one of a family of parts that provide options of fixed $\div 1$, fixed $\div 2$ and selectable $\div 1$, $\div 2$ modes as well as active high enable or active low enable to oscillator designers. Refer to Table 2 for the comparison of parts within the AZP5x and AZP63 family.

ENGINEERING NOTES**FUNCTIONALITY**

The AZP63 is one of a family of parts that provide options of fixed $\div 1$, fixed $\div 2$ and selectable $\div 1$, $\div 2$ modes as well as active high enable or active low enable to oscillator designers. Table 2 details the differences between the parts to assist designers in selecting the optimal part for their design.

Table 3 lists the specific AZP63 functional operation.

Figure 2 plots the S-parameters of the \bar{D} input. [S-parameter](#) and [IBIS](#) model files for the AZP63 are also available for download.

INPUT TERMINATION

The \bar{D} input bias is $V_{DD}/2$ fed through an internal $10k\Omega$ resistor. For clock applications, an input signal of at least $750mV_{pp}$ ensures the AZP63 meets AC specifications. The input should also be AC coupled to maintain a 50% duty cycle on the outputs. The input can be driven to any voltage between $0V$ and V_{DD} without damage or waveform degradation.

Figure 3 - Input Termination

THREE RESISTOR TERMINATION

Another termination variant eliminates the need for the additional supply (Figure 6). Alternately three resistors and one capacitor accomplish the same termination and reduce power consumption.

EVALUATION BOARD (EBP53)

Arizona Microtek's evaluation board EBP53 provides the most convenient way to test and prototype AZP63 series circuits. Built for the AZP53Q 1.5x1.0 mm package, it is designed to support both dual and single supply operation. Dual supply operation ($V_{DD}=+2.0V$, $V_{SS}=-1.3V$) enables direct coupling to 50Ω time domain test equipment (Figure 7).

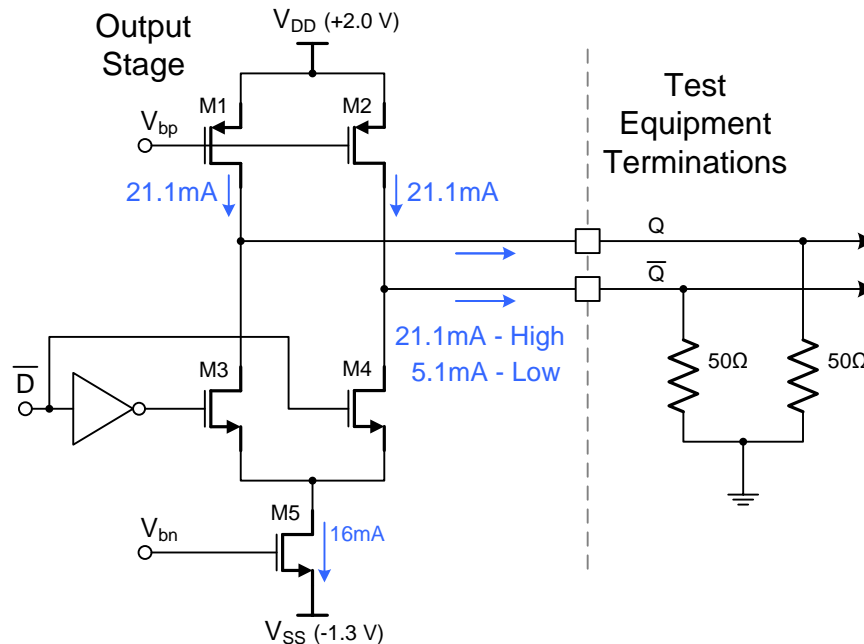

Figure 7 - Split Supply LVPECL Output Termination

AC TERMINATION

Clock applications or phase noise/frequency domain testing scenarios typically require AC coupling. Figure 8 below shows the AC coupling technique. The 200Ω resistors form the required DC loads, and the 50Ω resistors provide the AC termination. The parallel combination of the 200Ω and 50Ω resistors results in a net 40Ω AC load termination. In many cases this will work well. If necessary, the 50Ω resistors can be increased to about 56Ω. Alternately, bias tees combined with current setting resistors will eliminate the lowered AC load impedance. The 50Ω resistors are typically connected to ground but can be connected to the bias level needed by the succeeding stage.
