^{*1}: V_{IN(max)} and I_{O(max)} are restricted by the relation P_{D(max)}=(V_{IN}-V_O)•I_O=14(W).^{*2}: Refer to the dropout voltage.(Refer to Setting DC Input Voltage on page 7.)^{*3}: I_{S1} is specified at -5(%) drop point of output voltage V_O on the condition that V_{IN}=V_O+3V, I_O=0.2A.^{*4}: A foldback type overcurrent protection circuit is built into the IC regulator. Therefore, avoid using it for the following applications as it may cause starting errors:(1) Constant current load (2) Plus/minus power (3) Series power (4) V_O adjustment by raising ground voltage^{*5}: Output is ON even when output control terminal V_C is open. Each input level is equivalent to LS-TTL. Therefore, it may be directly driven by an LS-TTL circuit.^{*6}: When setting output voltage to 5V or less, input voltage needs to be set to 6V or over to operate stably.

Note on Thermal Protection:

The thermal protection circuit is intended for protection against heat during instantaneous short-circuiting. Its operation is not guaranteed for continuous heating condition such as short-circuiting over extended periods of time.
