

# 500mA SYNCHRONOUS STEP-DOWN DC/DC CONVERTERS

### DESCRIPTION

The UTC **UC3655** is a synchronous-rectification type DC/DC converters with a built-in 0.6Ω P-channel driver transistor and 0.7Ω N-channel switching transistor, which designed to allow the use of ceramic capacitors. Using only a coil and two capacitors connected externally, the **UC3655** enable a high efficiency, stable power supply with an output current of 500mA to be configured. Its operating voltage is 2.0V and the output voltage is programmable in a range from 0.9V to 4.0V in increments of 0.1V (accuracy: ±2.0%) internally. The oscillation frequency is 1.2MHz.

For operation mode, it is PWM control in the UTC **UC3655**, the UTC **UC3655** series is automatic PWM/PFM switching control, allowing fast response, low ripple and high efficiency over the full range of load.

Internal soft start and current control functions are built in it. All circuits are shutdown to reduce current consumption to as low as 1.0μA or less during standby mode. With the built-in Under Voltage Lock Out (U.V.L.O.) function, when input voltage becomes 1.4V or lower the internal P channel driver transistor is forced OFF.

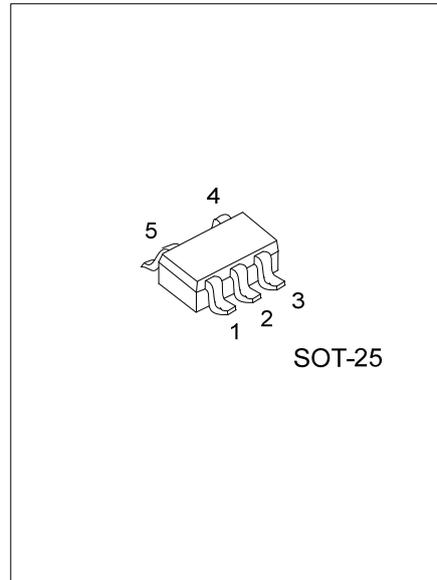

### FEATURES

- \* Very High Efficiency 92%
- \* Low Ripple Rejection Voltage 10mV
- \* Output Current 500mA @ $V_{IN}=3.0V$ ,  $V_{OUT}=1.8V$
- \* Oscillation Frequency is 1.2MHz
- \* With PWM / PFM Automatic Switching Control
- \* Maximum Duty Ratio is 100%
- \* Ceramic Capacitor Available

2. When temperature is high, a current of approximately 20 $\mu A$  (maximum) may leak.

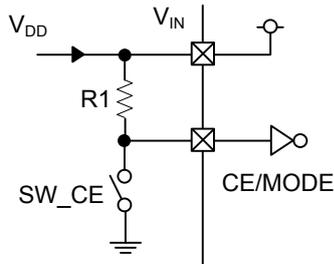

3. Time until it short-circuits DCOUT with GND through 1 $\Omega$  of resistance from a state of operation and is set to DCOUT=0V from current limit pulse generating.

■ OPERATIONAL EXPLANATION

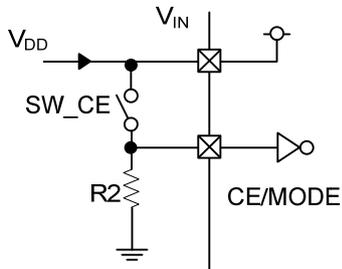

**CE / MODE Pin Function**

When a low level signal is input to the CE/MODE pin the operation of the **UC3655** series will enter into the shut down mode. In this mode, the current consumption occurs only in the detector and is 0  $\mu$ A (TYP.), with a state of high impedance at the Lx pin and VOUT pin. By inputting a high level signal to the CE/MODE pin the IC starts its operation. The input of the CE/MODE pin is a CMOS input and its sink current is 0  $\mu$ A (TYP.).
