### Description

Pericom Semiconductor's PI3B series of logic circuits are produced using the Company's advanced 0.35 micron CMOS technology.

The PI3B16292 and PI3B162292 are 3.3 volt, 12-bit to 24-bit Mux/Demux Bus switches designed with a low ON resistance allowing inputs to be connected directly to outputs.

The PI3B162292 device has a built-in 25-ohm series resistor to reduce noise resulting from reflections, thus eliminating the need for an external terminating resistor.

A2 port is not externally connected and, as a result, has an internal 500-ohm pulldown resistor to ground.

### Capacitance (T<sub>A</sub> = 25°C, f = 1 MHz)

Parameters <sup>(4)</sup>	Description	Test Conditions	Max.	Units
C <sub>IN</sub>	Input Capacitance	V <sub>IN</sub> = 0V	3.0	pF
C <sub>ON</sub>	A/B Capacitance, Switch On	V <sub>IN</sub> = 0V	30.0	pF

**Notes:**

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device.
2. Typical values are at V<sub>CC</sub> = 3.3V, T<sub>A</sub> = 25°C ambient and maximum loading.
3. Measured by the voltage drop between A and B pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A,B) pins.
4. This parameter is determined by device characterization but is not production tested.

### Power Supply Characteristics

Parameters	Description	Test Conditions <sup>(1)</sup>		Min.	Typ <sup>(2)</sup>	Max.	Units
I <sub>CC</sub>	Quiescent Power Supply Current	V <sub>CC</sub> = MAX.	V <sub>IN</sub> = GND or V <sub>CC</sub>	—	—	10	μA
ΔI <sub>CC</sub> <sup>(3)</sup>	Supply Current for S0 @ TTL HIGH	V <sub>CC</sub> = MAX.	V <sub>IN</sub> = 3.0 V <sup>(4)</sup> Other Inputs at V <sub>CC</sub> OR GND	—	—	750	μA
I <sub>CCD</sub>	Supply Current for S0 per MHz <sup>(5)</sup> Toggling 50% Duty Cycle	V <sub>CC</sub> = Max., A and B Pins Open		—	—	0.25	mA/ MHz

#### Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for applicable device.
2. Typical values are at V<sub>CC</sub> = 3.3V, +25°C ambient.
3. This is the increase in supply current for S0 at the specified TTL voltage level rather than V<sub>CC</sub> or GND.
4. Per driven input ( S0 only); A and B pins do not contribute to I<sub>CC</sub>.
5. This current applies to the control inputs only and represent the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is not tested, but is guaranteed by design.

### PI3B162292 Switching Characteristics over Operating Range

Parameters	Description	Conditions <sup>(1)</sup>	Com.		Units
			Min.	Max.	
t <sub>PLH</sub> t <sub>PHL</sub>	Propagation Delay <sup>(2,3)</sup> xA1 to xBx, xBx to xA1	C <sub>L</sub> = 50 pF R <sub>L</sub> = 500Ω R = 500Ω to 4.6V <sup>(4)</sup>	—	1.25	ns

t <sub>PHZ</sub> t <sub>PLZ</sub>	Bus Disable time S to xA1 or xBx		1	5.5	
t <sub>m</sub>	Make-before-break time <sup>(2)</sup>		0	2	

#### Notes:

1. See test circuit and waveforms.
2. This parameter is guaranteed but not tested.
3. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and load capacitance. The time constant for the switch alone is of the order of 0.25ns for 50pF load. Since this time constant is much smaller than rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
4. Applies to t<sub>PLZ</sub> and t<sub>PZL</sub>.
