

Description

The CPA and CPD Series are highly reliable power supplies for CompactPCI[®] systems, which are increasingly used in communications, industrial, military, aerospace, and other applications. These power supplies offer high power density in plug-in modules that meet the requirements of the PICMG[®] power interface specification for CompactPCI[®] systems.

The converters use the patented EDGE[™] technology and provide important advantages such as flexible output power, extremely high efficiency, excellent reliability, full input-to-output isolation, negligible inrush current, hot-swap capability, soft start, and overtemperature protection.

The inputs are protected against surges and transients occurring on the source lines and cover an operating input voltage range from either 90 to 264 VAC or 36 to 75 VDC. Voltage suppressor diodes protect the input against overvoltage.

Features

- RoHS lead-free-solder and lead-solder-exempted products are available
- Compliant with PICMG[®] CompactPCI[®] specifications
- Wide range DC or AC input with PFC
- Extremely high efficiency and high power density
- Low inrush current
- 4 high current outputs with flexible load distribution
- Integrated ORing FETs / diodes for true redundancy
- Inhibit and enable inputs
- Remote sense lines
- Single-wire current share function for 3 outputs
- Hot-swap capability
- 47-pin connector, type Positronic
- Overtemperature, overvoltage, overcurrent, and overpower protection

Safety according to IEC/EN 60950-1 and UL 60950-1

The outputs are protected against continuous overload, open-circuit, and short-circuit. Full n+1 redundant operating mode is made possible by integrated ORing FETs/diodes. When several converters are connected in parallel, a single-wire connection between converters ensures current sharing.

The converters are designed as two or three separate forward converters with fixed switching frequency and synchronous rectifiers at their output.

LEDs on the front panel and various warning signals display the status of the converter. The aluminum case acts as a heat sink and as an RFI shield. It is designed for vertical insertion into 19" rack systems, but it can also be mounted in any other position, as long as the necessary airflow is ensured. The connector is a 47-pin type from Positronic.

Model Selection

nominal output voltages and output currents, degree of protection, batch no., serial no., and data code including production site, modification status, and date of production. Identification of LEDs.

Functional Description

The converter input is protected against surges and transients occurring on the source lines. The highly efficient input filter and the active inrush current limiter ensure a very low inrush current of short duration. This prevents circuit breakers and fuses from tripping at switch-on.

All CPA models have an additional bridge rectifier and a boost converter to provide active power factor correction according to EN 61000-3-2.

The CPx200/250 models (see fig.1a) are equipped with two independent high efficiency 2-switch forward converters, switching 180° out of phase to minimize ripple current at the input. Both forward converters are fully regulated.

On the secondary side, two high current synchronous rectifiers supply the 5 V and 3.3 V outputs with up to 60 A. The secondary controlled +12 V post regulator is supplied by an additional winding of the 3.3 V main transformer, and the linear regulator for the -12 V output is supplied by the output choke of the +12 V output. After rectification, the output filter reduces ripple and noise to a minimum without compromising the dynamic response.

All outputs are protected from the bus by decoupling FETs or diodes. A current monitor calculates the output power. As

soon as the output power exceeds the maximum threshold level, the converter starts to reduce the output power by decreasing the output voltages.

In contrast to the outputs Vo1 (5 V), Vo2 (3.3 V), and Vo3 (+12 V) with active current sharing, output Vo4 (-12 V) has a droop characteristic for passive current sharing. The switching frequency is typically 135 kHz.

CPA500/550 models (see fig. 1b) exhibit a third forward converter for the outputs Vo3 (+12 V) and Vo4 (-12 V). All outputs are fully regulated.

If for some reason the voltage of any output exceeds the nominal value significantly, the converter is permanently shut down. If option L is fitted, this occurs as well, if the max. output current is exceeded for a predefined time. To reset, the input voltage must be removed.

Power-One's Efficient Dual Geometric Edge Technology (EDGE[™]) facilitates high current density, increases reliability by reducing component stresses, and decreases the amount of heat dissipated. The backbone of this patented technology is an interleaved, multi-channel forward converter utilising a transitional resonant switching technique and proprietary leading and trailing-edge pulse width modulation. It has a proven track record in high-availability power solutions.

⁴ Short interruption of V_i without affecting the outputs

Input Transient Protection

A metal oxide VDR (Voltage Dependent Resistor) together with the input fuse form an effective protection against high input voltage transients, which typically occur in most installations.

Input Fuse

An incorporated miniature slow-blow fuse protects the converter against further damage in the case of a failure.

Reverse polarity applied to the input of CPD models will cause the fuse to blow but without other damage.

Note: The fuse is not customer-accessible.

Table 3: Fuse specification

Model	Fuse rating	Reference
CDP200/250	250 V, 12.5 A T	Schurter 0001.2515
CPA200/250	250 VAC, 5 A T	Schurter 0001.2511
CPA500/550	250 VAC, 10 A T	Schurter 0034.6925

Inrush Current Limitation

The converters incorporate an active inrush current limiter in the input circuitry, which reduces the peak inrush current value by a factor of 10 – 15 to protect connectors and switching devices from damage.

Note: The inrush current limitation is achieved using electronic circuitry. For effective limitation the converter should not be switched on and off more frequently than every 8 seconds.

Reverse Polarity

To avoid unwanted power losses, the CPD Series converters are not protected against reverse polarity at the input. In case of reversed input voltage, the input suppressor diode will be conducting and trigger the input fuse to blow; however no further damage will occur.

The CPA Series converters are designed for AC input and have a rectifier bridge on the input.

Efficiency

The efficiency is specified in table 1. Fig. 2 shows the dependence on input voltage (CPA models). The efficiency of CPD models depends only marginally on input voltage.

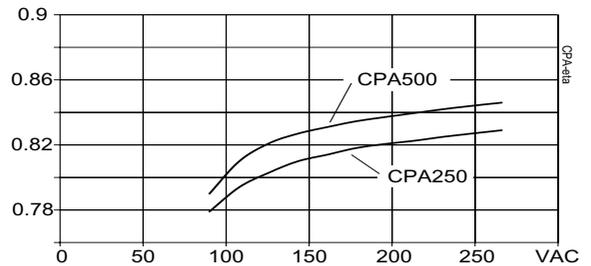

Fig. 2
CPA Series: Efficiency versus input voltage

Electrical Output Data

General Conditions:

– $T_A = 25\text{ °C}$, unless T_C is specified.

– CPD/CPA200: 250 LFM (1.25 m/s), CPD/CPA250: 400 LFM (2 m/s)

– Sense lines connected directly at the connector

Hold-up Time of CPD Models

For extended hold-up time of CPD models, use external output capacitors or decoupling diodes and input capacitors of adequate size.

Formula for additional external input capacitor:

$$C_{i\text{ ext}} = \frac{2 \cdot P_o \cdot (t_{h\text{ total}} - t_h) \cdot 100}{\eta \cdot (V_{ti}^2 - V_{i\text{ min}}^2)}$$

where as:

- $C_{i\text{ ext}}$ = external input capacitance [mF]
- P_o = output power [W]
- η = efficiency [%]
- $t_{h\text{ total}}$ = total hold-up time [ms]
- t_h = hold-up time [ms]
- $V_{i\text{ min}}$ = minimum input voltage [V]
- V_{ti} = threshold level [V]

Note: After V_i was removed, the outputs maintain their voltage for the time t_h . Even if V_i comes back during t_h , but after t_{bo} , the output voltage will be affected.

Hot Swap

Hot swap is possible. The output voltages may deviate dynamically by $\leq 5\%$ during the plug-in / plug-out operation.

Output Characteristic and Protection

All outputs are fully protected against continuous open-circuit (no load) and continuous short-circuit conditions.

All outputs of CPx200/250 models have a constant current limitation with a rectangular characteristic; see figure 3. In addition, the total power from outputs Vo1, Vo2, and Vo3 is limited to $P_{o\text{ max}}$, resulting in a free choice of load distribution between these outputs. Output Vo4 is disabled in the case of overtemperature generated by overcurrent.

In CPA500/550 models, the total power of all four outputs is limited to $P_{o\text{ max}}$.

In all models, all outputs are monitored for overvoltage condition. If an overvoltage of 120 – 130% is detected, the converter is permanently disabled. To reset, the input voltage must be removed for 60 seconds.

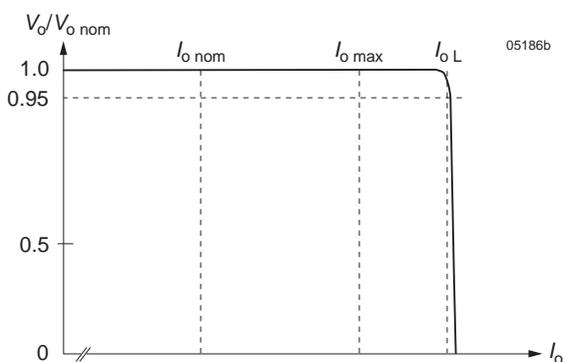

Fig. 3
Typical output characteristic V_o versus I_o

Thermal Considerations

If a converter is mounted in the upright position with airflow as specified in the general conditions of table 4 and 5, allowing unrestricted forced-air cooling, and is operated at

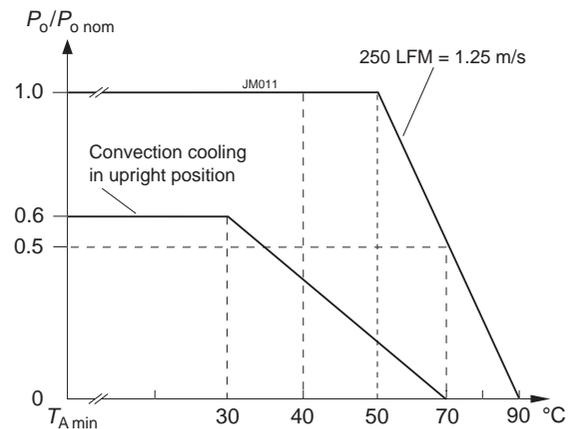

Fig. 4a
Output power versus temperature T_A at $V_{i\text{ nom}}$ (CPD/CPA200)

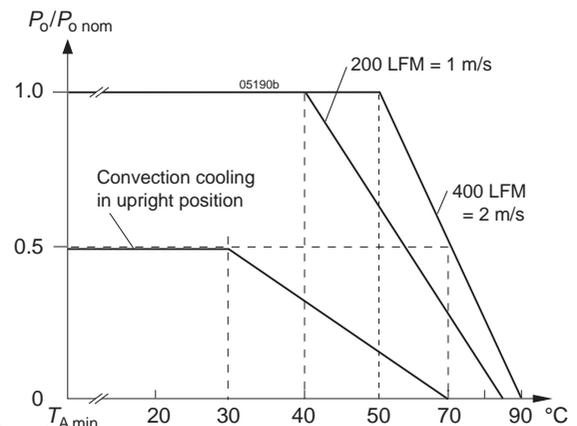

Fig. 4b
Output power versus temperature T_A at $V_{i\text{ nom}}$ (CPD/CPA250)

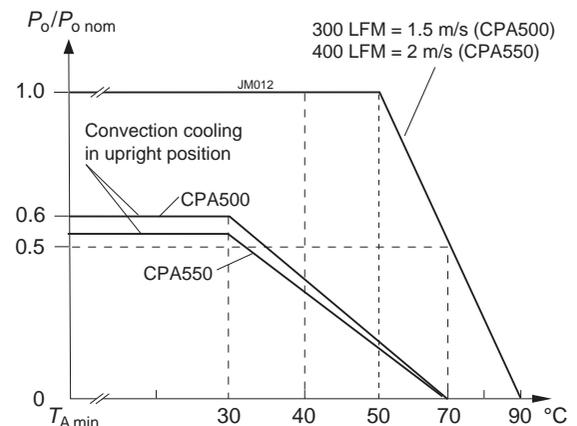

Fig. 4c
Output power versus temperature T_A at $V_{i\text{ nom}}$ (CPA500/550)

its nominal input voltage and power at maximum ambient temperature $T_{A \max}$ (see *Temperatures*), the temperature measured at the measurement point of the case temperature T_C (see *Mechanical Data*) will approach after an initial warm-up phase the indicated maximum value of $T_{C \max}$ (105 °C). However, the relationship between T_A and T_C depends heavily on the operating conditions and system integration. The thermal conditions are significantly influenced by the input voltage, the output current, the airflow, and the temperature of the adjacent elements and surfaces. $T_{A \max}$ is therefore only an indicative value (contrary to $T_{C \max}$).

Caution: The installer must ensure that under all operating conditions T_C remains within the limits shown in the diagrams of fig. 4.

Note: Forced-air cooling or an additional heat sink can improve the reliability or allow T_A to be increased above $T_{A \max}$, provided that $T_{C \max}$ is not exceeded.

Thermal Protection

A temperature sensor fitted on the main PCB provides an overtemperature warning (degrade) signal 15 °C below the temperature $T_{C \max}$, at which the thermal derating begins to reduce the output power. The output power returns to the normal value, when the temperature drops back below this

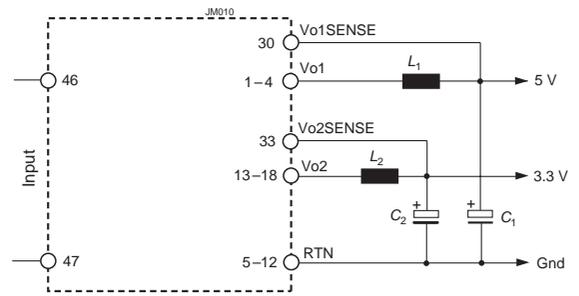

Fig. 5
Output filter reducing the output ripple of Vo1 and Vo2

limit; see *Temperature Warning and Shutdown*.

Output Filter

The output ripple voltage can be reduced by an external filter to less than 5 mV_{pp}. Recommended values:

- C1, C2: Low ESR capacitor, e.g., OS-CON 100 – 470 μF
- L1, L2: Choke 1 – 2.2 μH with appropriate rated current, e.g., Coiltronics[®] HC2LP 1 μH /33 A or 2.2 μH /24 A.

Auxiliary Functions

Inhibit and Enable

The inhibit input enables (logic high) or disables (logic low, pull down) all outputs, if a logic signal (TTL, CMOS) is

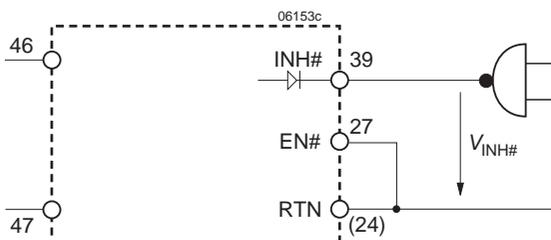

Fig. 6
Inhibit and enable inputs

Table 6: Inhibit data

Characteristics		Conditions	min	typ	max	Unit
V_{inh}	Inhibit voltage	$V_o = \text{off}$	$V_{i \min} - V_{i \max}$	-2	0.8	V
		$V_o = \text{on}$	$I_o = 0 - I_o \max$	2.4	50	
t_r	Rise time				120	ms
t_f	Fall time				depending on I_o	

applied. In systems consisting of several converters this feature may be used to control the activation sequence of the converters by means of logic signals, or to enable the source to start-up, before full load is applied.

Note: If this function is not used, the inhibit pin 39 can be left open-circuit (not connected). If pin 39 is connected to a return pin (e.g., pin 22), the internal logic will disable all outputs. The inhibit input is protected by a decoupling diode.

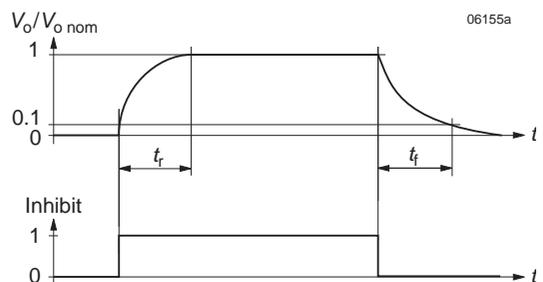

Fig. 7
Typical output response as a function of inhibit voltage.

The enable pin 27 (EN#) must be connected to a return pin (e.g., pin 22) enable the converter. Pin 27 is shorter than the others ensuring startup only, when all other pins are already connected to the system providing true hot-swap capability.

Temperature Warning and Shutdown

A temperature warning circuitry monitors the case temperature T_C . Its output signal $V_{DEG\#}$ changes from high to low impedance, when the T_C exceeds the upper threshold level, and changes back to high impedance, when T_C falls below the lower threshold level, which is $85\text{ }^\circ\text{C} \pm 5\text{ }^\circ\text{C}$.

Pin 38 (degrade signal DEG#) is internally connected via the collector-emitter path of an NPN transistor to the signal return pin 22. The current $I_{DEG\#}$ through pin 38 should not exceed 40 mA, and $V_{DEG\#}$ should not exceed 40 V.

If T_C exceeds $105\text{ }^\circ\text{C}$, the converter will be disabled. It resumes operation automatically, once T_C falls below $105\text{ }^\circ\text{C}$.

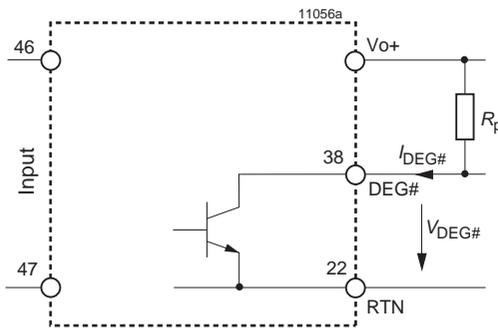

Fig. 8
Degrade signal: NPN output $V_{DEG\#} \leq 40\text{ V}$, $I_{DEG\#} \leq 20\text{ mA}$

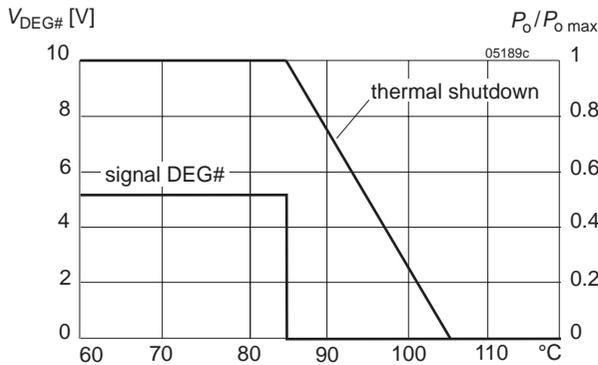

Fig. 9
Degrade signal $V_{DEG\#}$ versus case temperature T_C

Power Fail Signal

The power fail circuitry monitors the input voltage and all output voltages. Its output signal $V_{FAL\#}$ changes from high to low impedance ($<0.5\text{ V}$), when one of the monitored voltages falls below the threshold level; $V_{FAL\#}$ changes back to high impedance, when all monitored voltages exceed their threshold level.

The threshold levels correspond to approx. 85% of $V_{o\text{ nom}}$. $V_{i\text{ min}}$ of CPD200/250 up to Version V116 and CPA200/250 up to Version V115 is not monitored.

$V_{i\text{ min}}$ of CPA models is considered as insufficient, when v_i remains for typ. 30 ms below $\sqrt{2} \cdot V_{i\text{ min}}$.

Connector pin 42 (signal $V_{FAL\#}$) is internally connected via the drain-source path of a JFET (self-conducting type) to the signal return pin 22. The current $I_{FAL\#}$ should not exceed 10 mA. $V_{FAL\#}$ should not exceed 40 V, as the JFET is not protected against overvoltage.

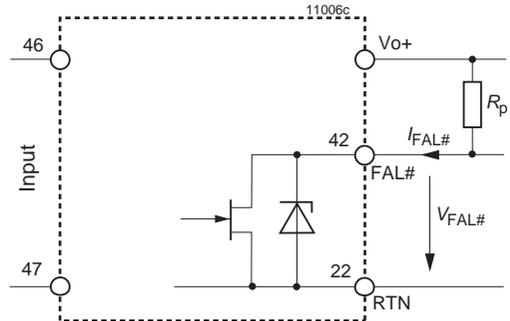

Fig. 10
Power Fail: JFET output, $I_{FAL\#} \leq 10\text{ mA}$

Sense Lines

(Only for Vo1, Vo2, and Vo3.)

This feature allows the compensation of voltage drops across the connector contacts and if necessary, across the load lines.

To ensure correct operation, all sense lines S+ (Vo1SENSE, Vo2SENSE, and Vo3SENSE) should be connected to the respective power outputs. The common sense return S- (SRTN) should be connected to RTN (pin 5 – 12).

Note: Open sense lines are admissible, but the output voltage regulation will be poor.

The voltage difference between any sense line at its respective power output pin (as measured on the connector) should not exceed the following values.

Note: If the sense lines S+ and S- compensate for a considerable voltage drop, the output loads shall be reduced in order to respect the maximum output power.

Table 7: Sense line data

Output [V]	Total voltage difference between sense lines and their respective outputs
3.3	0.8 V
5	1 V
12	1 V

Active Current Sharing for Vo1, Vo2, Vo3

The current sharing facility, consisting of a single-wire link, should be used, where several converters are operated in parallel connection, for example, high reliability n+1 redundant systems or systems providing higher output power.

Note: Not more than six converters should be connected in parallel.

Using this feature reduces the stress of the individual converters and improves the reliability of the system. Interconnection of the current sharing terminals causes the converters to share the output current evenly. In n+1 redundant systems a failure of a single converter will not lead to a system failure, since the outputs are already decoupled by FETs and diodes internally.

Passive Current Sharing for Vo4

The output voltage changes slightly with the output current (droop characteristic) ensuring automatic current sharing without further precautions, when several converters are

connected in parallel. An increase in output current decreases the output voltage according to fig. 11.

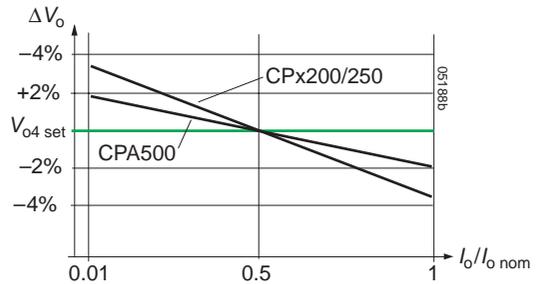

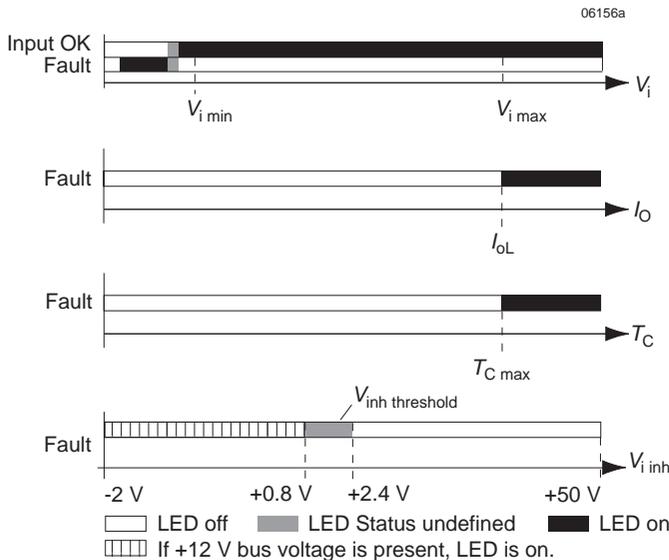

Fig. 11
Output voltage V_{o4} versus output current I_{o4} .

LEDs

A green LED "Input OK" and a red LED "Fault" are incorporated in the front panel.

LEDs "Input OK" and "Fault" status versus input voltage.
Conditions: $P_o - P_{o max}$, $T_c - T_{c max}$, $V_{inh} = open$

LED "Fault" status versus output current.
Conditions: $V_{i min} - V_{i max}$, $T_c - T_{c max}$, $V_{inh} = open$

LED "Fault" status versus case temperature.
Conditions: $P_o - P_{o max}$, $V_{i min} - V_{i max}$, $V_{inh} = open$

LED "Fault" status versus V_{inh} .
Conditions: $P_o - P_{o max}$, $V_{i min} - V_{i max}$, $T_c - T_{c max}$

Display status of LEDs

Electromagnetic Compatibility (EMC)

A metal oxide VDR together with an input fuse and filter form an effective protection against high input voltage transients,

which typically occur in most installations. The converters have been successfully tested to the following specifications:

Electromagnetic Immunity

Table 8: Immunity type tests

Phenomenon	Standard	Level	Coupling mode ¹	Value applied	Waveform	Source imped.	Test procedure	In oper.	Per-form. ²
Electrostatic discharge (to case)	IEC/EN 61000-4-2	4	contact discharge	8000 V _p	1/50 ns	330 Ω	10 positive and 10 negative discharges	yes	A
			air discharge	15000 V _p					
Electromagnetic field	IEC/EN 61000-4-3	3	antenna	10 V/m	AM 80% 1 kHz	n.a.	80 – 1000 MHz	yes	A
				10 V/m	50% duty cycle 200 Hz repetition frequency		900 ±5 MHz		
Electrical fast transients/burst	IEC/EN 61000-4-4	3	capacitive, o/c	1000 V _p	bursts of 5/50 ns 2.5/5 kHz over 15 ms; burst period: 300 ms	50 Ω	60 s positive 60 s negative transients per coupling mode	yes	A
			direct, i/c, +i/-i	2000 V _p					
Surges	IEC/EN 61000-4-5	3	i/c	2000 V _p	1.2/50 μs	12 Ω	5 pos. and 5 neg. surges per coupling mode	yes	B
		2	+i/-i	1000 V _p		2 Ω			
Conducted disturbances	IEC/EN 61000-4-6	3	i, o, signal wires	10 VAC (140 dBμV)	AM 80% 1 kHz	150 Ω	0.15 – 80 MHz	yes	A

¹ i = input, o = output, c = case connected to PE ⊕

² A = normal operation, no deviation from specifications, B = temporary deviation from specs possible.

Electromagnetic Emission

Radiated and conducted emissions comply with EN 55011/55022, class A. In addition, CPA500/550 meet conducted emissions class B.

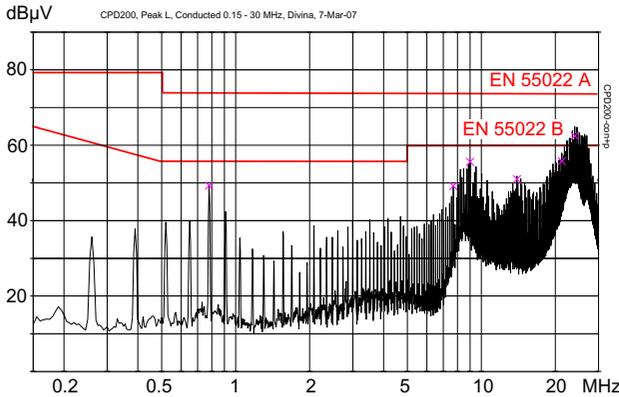

Fig. 13a

Safety and Installation Instructions

Connector Pin Allocation

The connector pin allocation table defines the electrical potentials and the physical pin positions on the Positronic connector. Pin no. 45 (protective earth) is a leading pin, ensuring that it makes contact with the female connector first.

Table 12: Pin allocation of the front connector

Pin ¹	Length ²	Signal name	Description
1-4	B	Vo1	Output 1
5-12	B	RTN	Return (Vo1 and Vo2)
13-18	B	Vo2	Output 2
19	B	RTN	Return (Vo3)
20	B	Vo3	Output 3
21	C	Vo4	Output 4
22	C	RTN	Return
23	C	Reserved	Reserved
24	C	RTN	Return (Vo4)
25	C	n.c.	Do not connect
26	C	Reserved	Reserved
27	D	EN#	Enable
28	C	n.c.	Do not connect
29	C	n.c.	Do not connect
30	C	Vo1SENSE	Vo1 remote sense
31	C	n.c.	Do not connect

¹ Pin numbers shown are for the female backplane connector

² A = very long pins, B = long pins, C = short pins, D = very short pins.

³ Pin 45 of the female connector is leading, ensuring that chassis ground makes contact first.

⁴ CPD models (DC input)

⁵ CPA models (AC input)

Installation Instructions

These converters are components, intended exclusively for installation within other equipment by an industrial assembly process or by a professionally, competent person. Installation must strictly follow the national safety regulations in respect of the enclosure, mounting, creepage distances, clearance, casualty markings, and segregation requirements of the end-use application.

Connection to the system shall be made via the mating female connector (see fig. 16). Other installation methods may not meet the safety requirements. Check for hazardous voltage before altering any connections.

The converters are provided with a leading pin no. 45, which is reliably connected to the case. For safety reasons it is essential to connect this pin to the protective earth of the supply system; see also *Safety of Operator-Accessible Output Circuits*.

The Vi input (pin no. 46) is internally fused. This fuse is designed to protect the converter in case of over current,

Connector: Positronic PCIH47M400A1 or similar

Mating female connector: Positronic PCIH47F300A1 or similar

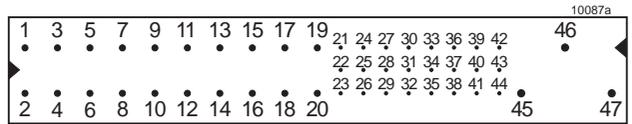

Fig. 18
Pinout of the front connector

Pin ¹	Length ²	Signal name	Description
32	C	n.c.	Do not connect
33	C	Vo2SENSE	Vo2 remote sense
34	C	SRTN	Sense return
35	C	Vo1SHARE	Vo1 current share
36	C	Vo3SENSE	Vo3 remote sense
37	C	n.c.	Do not connect
38	C	DEG#	Degrade signal
39	C	INH#	Inhibit
40	C	n.c.	Do not connect
41	C	Vo2SHARE	Vo2 current share
42	C	FAL#	Fail signal
43	C	n.c.	Do not connect
44	C	Vo3SHARE	Vo3 current share
45	A ³	CGND	Chassis ground
46	A	+DCIN ⁴ ACN ⁵	Positive input ⁴ Neutral line ⁵
47	A	-DCIN ⁴ ACL ⁵	Negative input ⁴ Line input(phase) ⁵

but may not be able to satisfy all customer requirements. External fuses in the wiring to one or both input pins (no. 46 and/or no. 47) may therefore be necessary to ensure compliance with local requirements.

Important: If the inhibit function is not used, pin 39 (i) should be left unconnected to enable the outputs. Enable Pin 27 (EN#) should be connected to pin 22 (RTN) to enable the outputs.

Do not open the converters, or the warranty will be invalidated. Make sure that there is sufficient airflow available for convection cooling. This should be verified by measuring the case temperature, when the converter is installed and operated in the end-use application. The maximum specified case temperature $T_{C\ max}$ should not be exceeded.

Make sure that a converter failure (e.g., by an internal short-circuit) does not result in a hazardous condition.

Standards and Approvals

The converters correspond to class I equipment.

All converters are approved according to UL 60950-1, CSA 60950-1, IEC 60950-1, and EN 60950-1.

The converters correspond to Class I equipment. The following considerations have been made during design concerning safety:

- Build-in component
- Basic insulation between input and output, based on 75 VDC. The input is identified as TNV-2.
- Operational insulation between output(s) and case
- Use in a pollution degree 2 environment.

The converters are subject to manufacturing surveillance in accordance with the above mentioned UL standards and ISO 9001:2000.

Cleaning Agents

The power supplies are not hermetically sealed. In order to avoid possible damage, any penetration of cleaning and other fluids shall be avoided.

Table 13: Isolation

Characteristic		CPD models		CPA models		Unit
		Input to (case + output)	Output to case	Input to (case + output)	Output to case	
Electric strength test	Actual factory test ≥ 1 s	1500 ¹	700	2200 ²	700	VDC
	AC test voltage equivalent to factory test	1000	500	1500	500	VAC
Insulation resistance at 500 VDC		>300	>300	>300	>300	MΩ

¹ According to IEC/EN 60950, subassemblies connecting input to output are pre-tested with ≥ 3 kVDC.

² According to IEC/EN 60950, subassemblies connecting input to output are pre-tested with ≥ 4.3 kVDC or 3 kVAC.

Options

Option L

All CPA/CPD models exhibit a latching shutdown, which is activated if one output voltage is too high; see *Output Characteristic and Protection*. If option L is fitted, this latch

is as well activated, if the current limit of one output is exceeded for approx. 0.5 s.

Option G

RoHS-compliant for all six substances.

Accessories

Frontpanel kit 3U/8TE, Schroff: YTB039.

NUCLEAR AND MEDICAL APPLICATIONS - Power-One products are not designed, intended for use in, or authorized for use as critical components in life support systems, equipment used in hazardous environments, or nuclear control systems without the express written consent of the respective divisional president of Power-One, Inc.

TECHNICAL REVISIONS - The appearance of products, including safety agency certifications pictured on labels, may change depending on the date manufactured. Specifications are subject to change without notice.

EC Declaration of Conformity

CE MARKING

We, **Power-One, Inc., 740 Calle Plano, Camarillo, CA. 93012 USA**
declare under our sole responsibility that the products;

Power Supply Model: CPD200 and CPD250 Series

to which this declaration relates, is/are in compliance with the following document(s):

Quality Standard(s): **ISO 9001, EN 29001**

Directive: **DIR 73/23/EEC, Low Voltage Directive**

Product Safety Standard(s): **EN 60950-1: 2001**
IEC 60950-1: 2001
(Licensed by a Notified Body to the European Union)

These component level power supplies are intended exclusively for inclusion within other equipment by an industrial assembly operation or by professional installers per the Installation Instructions provided with the power supplies. The power supply is considered Class I and must be connected to a reliable earth grounding system.
