ADSL VCXO CLOCK SOURCE

MK3732-07

Description

The MK3732-07 is a low cost, low jitter, high performance VCXO and PLL clock synthesizer designed to replace expensive VCXO modules and oscillators. The on-chip Voltage Controlled Crystal Oscillator (VCXO) accepts a 0 to 3.3 V input voltage to cause the output clocks to vary by ±100 ppm. Using ICS' patented VCXO and analog Phase-Locked Loop (PLL) techniques, the device uses an inexpensive 13.248 MHz pullable crystal input to produce one or two output clocks.

The MK3732-07 is a pin-to-pin replacement for the MK2732-07 when using +3.3V supply voltage.

ICS manufactures the largest variety of xDSL clock synthesizers for all applications. Consult ICS to eliminate VCXOs, crystals, and oscillators from your board.

Features

- Packaged in 16 pin (150 mil) SOIC
- Replaces a VCXO and oscillator
- Ideal for Asymmetrical Digital Subscriber Line (ADSL) chipsets
- Uses an inexpensive pullable crystal
- On-chip patented VCXO with pull range of 200 ppm (± 100 ppm) minimum
- VCXO tuning voltage of 0 to 3.3 V
- 12 mA output drive capability at TTL levels
- Advanced, low power, sub-micron CMOS process
- Operating voltage of 3.3V
- Industrial temperature range available

Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	X2	Input	Crystal connection. Connect to a pullable crystal of 13.248 MHz.
2	X1	Input	Crystal connection. Connect to a pullable crystal of 13.248 MHz.
3,5,13	VDD	Power	Connect to +3.3V.
4	VIN	Input	Voltage input to VCXO. Zero to 3.3V signal which controls the VCXO frequency.
6,12,14	GND	Power	Connect to ground.
7	CLK1	Output	Clock output #1 per table above.
8	CLK2	Output	Clock output #2 per table above.
9	S2	Input	Select input #2. Selects outputs per table above. Internal pull-up resistor.
10	OE	Input	Output enable. Tri-states outputs when low. Internal pull-up resistor.
11	S0	Input	Select input #0. Selects outputs per table above.
15	NC	-	No connect. Do not connect anything to this pin.
16	S1	Input	Select input #1. Selects outputs per table above.

External Component Selection

The MK3732-07 requires a minimum number of external components for proper operation.

Decoupling Capacitors

Decoupling capacitors of 0.01μF should be connected between VDD and GND on pins 3 and 6, on pins 5 and 6, and on pins 13 and 14, as close to the MK3732-07 as possible. For optimum device performance, the decoupling capacitors should be mounted on the component side of the PCB. Avoid the use of vias in the decoupling circuit.

Series Termination Resistor

When the PCB traces between the clock outputs and the loads are over 1 inch, series termination should be used. To series terminate a 50Ω trace (a commonly used trace impedance) place a 33Ω resistor in series with the clock line, as close to the clock output pin as possible. The nominal impedance of the clock output is 20Ω.

Quartz Crystal

The MK3732-07 VCXO function consists of the external crystal and the integrated VCXO oscillator circuit. To assure the best system performance (frequency pull range) and reliability, a crystal device with the recommended parameters must be used, and the layout guidelines discussed in the following section must be followed.

The frequency of oscillation of a quartz crystal is determined by its “cut” and by the load capacitors connected to it. The MK3732-07 incorporates on-chip variable load capacitors that “pull” (change) the frequency of the crystal. The crystal specified for use with the MK3732-07 is designed to have zero frequency error when the total of on-chip + stray capacitance is 14pF.

The external crystal must be connected as close to the chip as possible and should be on the same side of the PCB as the MK3732-07. There should be no via’s between the crystal pins and the X1 and X2 device pins. There should be no signal traces underneath or close to the crystal.

Please see application note MAN05 for recommended crystal parameters and suppliers.

Crystal Tuning Load Capacitors

The crystal traces should include pads for small fixed capacitors, one between X1 and ground, and another between X2 and ground. Stuffing of these capacitors on the PCB is optional. The need for these capacitors is determined at system prototype evaluation, and is influenced by the particular crystal used (manufacture and frequency) and by PCB layout. The typical required capacitor value is 1 to 4 pF.

The procedure for determining the value of these capacitors can be found in application note MAN05.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the MK3732-07. These ratings, which are standard values for ICS commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
