**Note 1:** Exceeding the absolute maximum rating may damage the device.

**Note 2:** The device is not guaranteed to function outside its operating rating.

**Note 3:** The maximum allowable power dissipation at any T<sub>A</sub> (ambient temperature) is calculated using: PD(MAX) = (T<sub>J</sub>(MAX)- T<sub>A</sub>)/θ<sub>JA</sub>. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown. See Table 1 and the “Thermal Considerations” section for details.

**Note 4:** Output voltage temperature coefficient is the worst-case voltage change divided by the total temperature range.

**Note 5:** Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 10mA to 200mA. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

**Note 6:** Dropout voltage is defined as the input to output differential at which the output voltage drops 2% below it's nominal value measured at 1V differential.
