

September 1995

Features

- 1.2 Micron Radiation Hardened Bulk CMOS
- Total Dose 3×10^5 RAD (Si)
- Transient Output Upset $>5 \times 10^8$ RAD (Si)/s
- LET >100 MEV-cm²/mg
- Fast Access Time - 35ns (Typical)
- Single 5V Power Supply
- Single Pulse 10V Field Programmable
- Synchronous Operation
- On-Chip Address Latches
- Three-State Outputs
- NiCr Fuses
- Low Standby Current $<500\mu\text{A}$ (Pre-Rad)
- Low Operating Current $<15\text{mA/MHz}$
- Military Temperature Range -55°C to $+125^\circ\text{C}$

Description

The Harris HS-6664RH is a radiation hardened 64K CMOS PROM, organized in an 8K word by 8-bit format. The chip is manufactured using a radiation hardened CMOS process, and utilizes synchronous circuit design techniques to achieve high speed performance with very low power dissipation.

On-chip address latches are provided, allowing easy interfacing with microprocessors that use a multiplexed address/data bus structure. The output enable control ($\overline{G}$) simplifies system interfacing by allowing output data bus control in addition to the chip enable control ($\overline{E}$). All bits are manufactured storing a logical "0" and can be selectively programmed for a logical "1" at any bit location.

Applications for the HS-6664RH CMOS PROM include low power microprocessor based instrumentation and communications systems, remote data acquisition and processing systems, and processor control storage.

Specifications HS-6664RH

Absolute Maximum Ratings

Supply Voltage (All Voltages Reference to Device GND) +7.0V
 Input or Output Voltage
 Applied for All Grades. GND-0.3V to VDD+0.3V
 Storage Temperature Range -65°C to +150°C
 Junction Temperature +175°C
 Lead Temperature (Soldering 10s) +300°C
 ESD Classification Class 1

Reliability Information

Thermal Resistance θ_{JA} θ_{JC}
 Braze Seal DIP Package 40.0°C/W 4.0°C/W
 Braze Seal Flatpack Package 53.4°C/W 6.0°C/W
 Maximum Package Power Dissipation at +125°C
 Braze Seal DIP Package 1.75W
 Braze Seal Flatpack Package 936mW
 Gate Count 26,817 Gates

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Operating Conditions

Operating Supply Voltage Range (VDD) +4.5V to +5.5V
 Operating Temperature Range (T_A) -55°C to +125°C
 Input Low Voltage (VIL)0V to +0.8V
 Input High Voltage (VIH) +2.4V to VDD

TABLE 1. DC ELECTRICAL PERFORMANCE CHARACTERISTICS

Device Guaranteed and 100% Tested.

PARAMETER	SYMBOL	(NOTES 1, 2) CONDITIONS	GROUP A SUBGROUPS	TEMPERATURE	LIMITS		UNITS
					MIN	MAX	
High Level Output Voltage	VOH1	VDD = 4.5V, IO = -2.0mA	1, 2, 3	-55°C ≤ T _A ≤ +125°C	3.5	-	V
Output High Voltage	VOH2	VDD = 4.5V, IO = 100μA	3	-55°C ≤ T _A ≤ +125°C	VDD -0.3V	-	V
Low Level Output Voltage	VOL	VDD = 4.5V, IO = 4.8mA	1, 2, 3	-55°C ≤ T _A ≤ +125°C	-	0.4	V
High Impedance Output Leakage Current	IOZ	VDD = 5.5V, $\overline{G}$ = 5.5V, VI/O = GND or VDD	1, 2, 3	-55°C ≤ T _A ≤ +125°C	-10.0	10.0	μA
Input Leakage Current	II	VDD = 5.5V, VI = GND or VDD, $\overline{P}$ Not Tested	1, 2, 3	-55°C ≤ T _A ≤ +125°C	-1.0	1.0	μA
Standby Supply Current	IDDSB	VDD = 5.5V, IO = 0mA, VI = VDD or GND	1, 2, 3	-55°C ≤ T _A ≤ +125°C	-	500	μA
Operating Supply Current	IDDOP	VDD = 5.5V, $\overline{G}$ = VDD, (Note 3), f = 1MHz, IO = 0mA, VI = VDD or GND	1, 2, 3	-55°C ≤ T _A ≤ +125°C	-	15	mA
Functional Test	FT	VDD = 4.5V (Note 4)	7, 8A, 8B	-55°C ≤ T _A ≤ +125°C	-	-	-

NOTES:

1. All voltages referenced to device GND.
2. All tests performed with $\overline{P}$ hardwired to VDD.
3. Typical derating = 15mA/MHz increase in IDDOP.
4. Tested as follows: f = 1MHz, VIH = 2.4V, VIL = 0.45V, IOH = -1mA, IOL = +1mA, VOH ≥ 1.5V, VOL ≤ 1.5V.

TABLE 2. AC ELECTRICAL PERFORMANCE CHARACTERISTICS

Device Guaranteed and 100% Tested.

PARAMETER	SYMBOL	(NOTES 1, 2, 3) CONDITIONS	GROUP A SUBGROUPS	TEMPERATURE	LIMITS		UNITS
					MIN	MAX	
Output Enable Access Time	TGLQV	VDD = 4.5V and 5.5V	9, 10, 11	-55°C ≤ T _A ≤ +125°C	-	20	ns
Chip Enable Access Time	TELQV	VDD = 4.5V and 5.5V	9, 10, 11	-55°C ≤ T _A ≤ +125°C	-	60	ns
Address Setup Time	TAVEL	VDD = 4.5V and 5.5V	9, 10, 11	-55°C ≤ T _A ≤ +125°C	5	-	ns

NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark.
2. The maximum limits of lead dimensions b and c or M shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
3. Dimensions b1 and c1 apply to lead base metal only. Dimension M applies to lead plating and finish thickness.
4. Corner leads (1, N, N/2, and N/2+1) may be configured with a partial lead paddle. For this configuration dimension b3 replaces dimension b2.
5. Dimension Q shall be measured from the seating plane to the base plane.
6. Measure dimension S1 at all four corners.
7. Measure dimension S2 from the top of the ceramic body to the nearest metallization or lead.
8. N is the maximum number of terminal positions.
9. Braze fillets shall be concave.
10. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
11. Controlling dimension: INCH.

NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark. Alternately, a tab (dimension k) may be used to identify pin one.
2. If a pin one identification mark is used in addition to a tab, the limits of dimension k do not apply.
3. This dimension allows for off-center lid, meniscus, and glass overrun.
4. Dimensions b1 and c1 apply to lead base metal only. Dimension M applies to lead plating and finish thickness. The maximum limits of lead dimensions b and c or M shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
5. N is the maximum number of terminal positions.
6. Measure dimension S1 at all four corners.
7. For bottom-brazed lead packages, no organic or polymeric materials shall be molded to the bottom of the package to cover the leads.
8. Dimension Q shall be measured at the point of exit (beyond the meniscus) of the lead from the body. Dimension Q minimum shall be reduced by 0.0015 inch (0.038mm) maximum when solder dip lead finish is applied.
9. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
10. Controlling dimension: INCH.

DESIGN INFORMATION (Continued)

The information contained in this section has been developed through characterization by Harris Semiconductor and is for use as application and design information only. No guarantee is implied.

Background Information Programming

The HS-6664 CMOS PROM is manufactured with all bits containing a logical zero (output low). Any bit can be programmed selectively to a logical one (output high) state by following the procedure shown below. To accomplish this, a programmer can be built that meets the specifications shown, or use of an approved commercial programmer is recommended.

Programming Sequence of Events

1. Apply a voltage of VDD1 to VDD of the PROM.
2. Read all fuse locations to verify that the PROM is blank (output low).
3. Place the PROM in the initial state for programming:
 $\bar{E} = \text{VIH}$, $\bar{P} = \text{VIH}$, $\bar{G} = \text{VIL}$.
4. Apply the correct binary address for the word to be programmed. No inputs should be left open circuit.
5. After a delay of t_d , apply voltage of VIL to $\bar{E}$ (pin 20) to access the addressed word.
6. The address may be held through the cycle, but must be held valid at least for a time equal to t_d after the falling edge of $\bar{E}$. None of the inputs should be allowed to float to an invalid logic level.
7. After a delay of t_d , disable the outputs by applying a voltage of VIH to $\bar{G}$ (pin 22).
8. After a delay of t_d , apply voltage of VIL to $\bar{P}$ (pin 27).
9. After delay of t_d , raise VDD (pin 28) to VDDPROG with a rise time of t_r . All outputs at VIH should track VDD within VDD-2.0V to VDD+0.3V. This could be accomplished by pulling outputs at VIH to VDD through pull-up resistors of value R_n .
10. After a delay of t_d , pull the output which corresponds to the bit to be programmed to VIL. Only one bit should be programmed at a time.
11. After a delay of t_{pw} , allow the output to be pulled to VIH through pull-up resistor R_n .
12. After a delay of t_d , reduce VDD (pin 28) to VDD1 with a fall time of t_f . All outputs at VIH should track VDD with VDD-2.0V to VDD+0.3V. This could be accomplished by pulling outputs at VIH to VDD through pull-up resistors of value R_n .
13. Apply a voltage of VIH to $\bar{P}$ (pin 27).
14. After a delay of t_d , apply a voltage of VIL to $\bar{G}$ (pin 22).

15. After a delay of t_d , examine the outputs for correct data. If any location verifies incorrectly, it should be considered a programming reject.
16. Repeat steps 3 through 15 for all other bits to be programmed in the PROM.

Post-Programming Verification

17. Place the PROM in the post-programming verification mode:
 $\bar{E} = \text{VIH}$, $\bar{G} = \text{VIL}$, $\bar{P} = \text{VIH}$, VDD (pin 28) = VDD1.
18. Apply the correct binary address of the word to be verified to the PROM.
19. After a delay of t_d , apply a voltage of VIL to $\bar{E}$ (pin 20).
20. After a delay of t_d , examine the outputs for correct data. If any location fails to verify correctly, the PROM should be considered a programming reject.
21. Repeat steps 17 through 20 for all possible programming locations.

Post-Programming Read

22. Apply a voltage of VDD2 = 4.0V to VDD (pin 28).
23. After a delay of t_d , apply a voltage of VIH to $\bar{E}$ (pin 20).
24. Apply the correct binary address of the word to be read.
25. After a delay of TAVEL, apply a voltage of VIL to $\bar{E}$ (pin 20).
26. After a delay of TELQV, examine the outputs for correct data. If any location fails to verify correctly, the PROM should be considered a programming reject.
27. Repeat steps 23 through 26 for all address locations.
28. Apply a voltage of VDD2 = 6.0V to VDD (pin 28).
29. Repeat steps 23 through 26 for all address locations.

DESIGN INFORMATION (Continued)

The information contained in this section has been developed through characterization by Harris Semiconductor and is for use as application and design information only. No guarantee is implied.
