The **CZM1-100** is a fundamental mode reflection oscillator that utilizes a silicon bipolar transistor and hyper-abrupt silicon varactor diodes to create a highly linear VCO with wideband tuning characteristics. The device is useful for many wireless applications where high frequency and linear modulation is required.

The process is very repeatable from unit to unit and assembled in ISO 9001 approved manufacturing facility with the latest surface mount equipment. Every unit is DC and RF tested with our fully automated computerized test stations to provide the highest reliable product.
