

# 1Mb SYNCBURST™ SRAM

**MT58L64L18P, MT58L32L32P,  
MT58L32L36P**
**3.3V V<sub>DD</sub>, 3.3V I/O, Pipelined, Single-  
Cycle Deselect**

## FEATURES

- Fast clock and OE# access times
- Single +3.3V +0.3V/-0.165V power supply (V<sub>DD</sub>)
- Separate +3.3V +0.3V/-0.165V isolated output buffer supply (V<sub>DDQ</sub>)
- SNOOZE MODE for reduced-power standby
- Single-cycle deselect (Pentium® BSRAM-compatible)
- Common data inputs and data outputs
- Individual BYTE WRITE control and GLOBAL WRITE
- Three chip enables for simple depth expansion and address pipelining
- Clock-controlled and registered addresses, data I/Os and control signals
- Internally self-timed WRITE cycle
- Burst control pin (interleaved or linear burst)
- Automatic power-down for portable applications
- 100-lead TQFP for high density, high speed SRAMs
- Low capacitive bus loading
- x18, x32, and x36 options available

## OPTIONS

- Timing (Access/Cycle/MHz)
  - 3.5ns/6.0ns/166 MHz
  - 4.2ns/7.5ns/133 MHz
  - 5ns/10ns/100 MHz
- Configurations
  - 64K x 18
  - 32K x 32
  - 32K x 36
- Package
  - 100-pin TQFP
- Operating Temperature Range
  - Commercial (0°C to +70°C)

## GENERAL DESCRIPTION

The Micron® SyncBurst™ SRAM family employs high-speed, low-power CMOS designs that are fabricated using an advanced CMOS process.

The MT58L64L18P and MT58L32L32/36P 1Mb SRAMs integrate a 64K x 18, 32K x 32, or 32K x 36 SRAM core with advanced synchronous peripheral circuitry and a 2-bit burst counter. All synchronous inputs pass

## 100-Pin TQFP\*

\*JEDEC-standard MS-026 BHA (LQFP).

through registers controlled by a positive-edge-triggered single clock input (CLK). The synchronous inputs include all addresses, all data inputs, active LOW chip enable (CE#), two additional chip enables for easy depth expansion (CE2, CE2#), burst control inputs (ADSC#, ADSP#, ADV#), byte write enables (BWx#) and global write (GW#).

Asynchronous inputs include the output enable (OE#), clock (CLK) and snooze enable (ZZ). There is also a burst mode pin (MODE) that selects between interleaved and linear burst modes. The data-out (Q), enabled by OE#, is also asynchronous. WRITE cycles can be from one to two bytes wide (x18) or from one to four bytes wide (x32/x36), as controlled by the write control inputs.

Burst operation can be initiated with either address status processor (ADSP#) or address status controller (ADSC#) input pins. Subsequent burst addresses can be internally generated as controlled by the burst advance pin (ADV#).

Address and write control are registered on-chip to simplify WRITE cycles. This allows self-timed WRITE cycles. Individual byte enables allow individual bytes to be written. During WRITE cycles on the x18 device, BWa# controls DQa pins and DQP<sub>a</sub>; BWb# controls DQb pins and DQP<sub>b</sub>. During WRITE cycles on the x32 and x36 devices, BWa# controls DQa pins and DQP<sub>a</sub>; BWb# controls DQb pins and DQP<sub>b</sub>; BWc# controls DQc pins

**NOTE:** Functional Block Diagrams illustrate simplified device operation. See Truth Table, Pin Descriptions and timing diagrams for detailed information.

## GENERAL DESCRIPTION (continued)

and DQPc; BWd# controls DQd pins and DQPd. GW# LOW causes all bytes to be written. Parity pins are only available on the x18 and x36 versions.

This device incorporates a single-cycle deselect feature during READ cycles. If the device is immediately deselected after a READ cycle, the output bus goes to a High-Z state <sup>1</sup>KQHZ nanoseconds after the rising edge of clock.

Micron's 1Mb SyncBurst SRAMs operate from a +3.3V power supply, and all inputs and outputs are TTL-compatible. The device is ideally suited for Pentium and PowerPC pipelined systems and systems that benefit from a very wide, high-speed data bus. The device is also ideal in generic 16-, 18-, 32-, 36-, 64- and 72-bit-wide applications.

Please refer to Micron's Web site ([www.micron.com/sramds](http://www.micron.com/sramds)) for the latest data sheet.

## TQFP PIN ASSIGNMENT TABLE

| 88                                             | 88                                              | GW#                          | Input | Global Write: This active LOW input allows a full 18-, 32- or 36-bit WRITE to occur independent of the BWE# and BWx# lines and must meet the setup and hold times around the rising edge of CLK.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 89                                             | 89                                              | CLK                          | Input | Clock: This signal registers the address, data, chip enable, byte write enables and burst control inputs on its rising edge. All synchronous inputs must meet setup and hold times around the clock's rising edge.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 98                                             | 98                                              | CE#                          | Input | Synchronous Chip Enable: This active LOW input is used to enable the device and conditions the internal use of ADSP#. CE# is sampled only when a new external address is loaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 92                                             | 92                                              | CE2#                         | Input | Synchronous Chip Enable: This active LOW input is used to enable the device and is sampled only when a new external address is loaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 97                                             | 97                                              | CE2                          | Input | Synchronous Chip Enable: This active HIGH input is used to enable the device and is sampled only when a new external address is loaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 86                                             | 86                                              | OE#                          | Input | Output Enable: This active LOW, asynchronous input enables the data I/O output drivers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 83                                             | 83                                              | ADV#                         | Input | Synchronous Address Advance: This active LOW input is used to advance the internal burst counter, controlling burst access after the external address is loaded. A HIGH on this pin effectively causes wait states to be generated (no address advance). To ensure use of correct address during a WRITE cycle, ADV# must be HIGH at the rising edge of the first clock after an ADSP# cycle is initiated.                                                                                                                                                                                                                              |
| 84                                             | 84                                              | ADSP#                        | Input | Synchronous Address Status Processor: This active LOW input interrupts any ongoing burst, causing a new external address to be registered. A READ is performed using the new address, independent of the byte write enables and ADSC#, but dependent upon CE#, CE2 and CE2#. ADSP# is ignored if CE# is HIGH. Power-down state is entered if CE2 is LOW or CE2# is HIGH.                                                                                                                                                                                                                                                                |

| WRITE Cycle, Suspend Burst   | Current      | H   | X    | X   | L  | X     | H     | H    | L      | X   | L-H | D      |

- NOTE:**
1. X means "Don't Care." # means active LOW. H means logic HIGH. L means logic LOW.
  2. For WRITE#, L means any one or more byte write enable signals (BWA#, BWB#, BWC# or BWD#) and BWE# are LOW or GW# is LOW. WRITE# = H for all BWx#, BWE#, GW# HIGH.
  3. BWA# enables WRITES to DQa pins, DQPa. BWB# enables WRITES to DQb pins, DQPb. BWC# enables WRITES to DQc pins, DQPC. BWD# enables WRITES to DQd pins, DQPD. DQPa and DQPb are only available on the x18 and x36 versions. DQPC and DQPD are only available on the x36 version.
  4. All inputs except OE# and ZZ must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.
  5. Wait states are inserted by suspending burst.
  6. For a WRITE operation following a READ operation, OE# must be HIGH before the input data setup time and held HIGH throughout the input data hold time.
  7. This device contains circuitry that will ensure the outputs will be in High-Z during power-up.
  8. ADSP# LOW always initiates an internal READ at the L-H edge of CLK. A WRITE is performed by setting one or more byte write enable signals and BWE# LOW or GW# LOW for the subsequent L-H edge of CLK. Refer to WRITE timing diagram for clarification.

### ABSOLUTE MAXIMUM RATINGS\*

Voltage on V<sub>DD</sub> Supply Relative to V<sub>SS</sub> .... -0.5V to +4.6V  
 Voltage on V<sub>DDQ</sub> Supply  
     Relative to V<sub>SS</sub> ..... -0.5V to +4.6V  
 V<sub>IN</sub> -0.5V to V<sub>DDQ</sub> + 0.5V  
 Storage Temperature (plastic) ..... -55°C to +150°C  
 Junction Temperature\*\* ..... +150°C  
 Short Circuit Output Current..... 100mA

\*Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

\*\*Maximum junction temperature depends upon package type, cycle time, loading, ambient temperature and airflow. See Micron Technical Note TN-05-14 for more information.

### DC ELECTRICAL CHARACTERISTICS AND OPERATING CONDITIONS

(0°C ≤ T<sub>A</sub> ≤ +70°C; V<sub>DD</sub>, V<sub>DDQ</sub> = +3.3V +0.3V/-0.165V unless otherwise noted)

| DESCRIPTION                   | CONDITIONS                                                    | SYMBOL           | MIN   | MAX                   | UNITS | NOTES |
|-------------------------------|---------------------------------------------------------------|------------------|-------|-----------------------|-------|-------|
| Input High (Logic 1) Voltage  |                                                               | V <sub>IH</sub>  | 2.0   | V <sub>DD</sub> + 0.3 | V     | 1, 2  |
| Input Low (Logic 0) Voltage   |                                                               | V <sub>IL</sub>  | -0.3  | 0.8                   | V     | 1, 2  |

| Output High Voltage           | I <sub>OH</sub> = -4.0mA                                      | V <sub>OH</sub>  | 2.4   | –                     | V     | 1, 4  |
| Output Low Voltage            | I <sub>OL</sub> = 8.0mA                                       | V <sub>OL</sub>  | –     | 0.4                   | V     | 1, 4  |
| Supply Voltage                |                                                               | V <sub>DD</sub>  | 3.135 | 3.6                   | V     | 1     |
| Isolated Output Buffer Supply |                                                               | V <sub>DDQ</sub> | 3.135 | V <sub>DD</sub>       | V     | 1, 5  |

- NOTE:**
1. All voltages referenced to V<sub>SS</sub> (GND).
  2. Overshoot: V<sub>IH</sub> ≤ +4.6V for t ≤ t<sub>KC</sub>/2 for I ≤ 20mA  
 Undershoot: V<sub>IL</sub> ≥ -0.7V for t ≤ t<sub>KC</sub>/2 for I ≤ 20mA  
 Power-up: V<sub>IH</sub> ≤ +3.6V and V<sub>DD</sub> ≤ 3.135V for t ≤ 200ms
  3. MODE pin has an internal pull-up, and input leakage = ±10μA.
  4. The load used for V<sub>OH</sub>, V<sub>OL</sub> testing is shown in Figure 2. AC load current is higher than the shown DC values. AC I/O curves are available upon request.
  5. V<sub>DDQ</sub> should never exceed V<sub>DD</sub>. V<sub>DD</sub> and V<sub>DDQ</sub> can be connected together.

**I<sub>DD</sub> OPERATING CONDITIONS AND MAXIMUM LIMITS**

 (0°C ≤ T<sub>A</sub> ≤ +70°C; V<sub>DD</sub>, V<sub>DDQ</sub> = +3.3V +0.3V/-0.165V unless otherwise noted)

| DESCRIPTION                     | CONDITIONS                                                                                                                                                                                  | SYMBOL           | TYP | MAX |      |     | UNITS | NOTES   |

**TQFP THERMAL RESISTANCE**

| DESCRIPTION                                  | CONDITIONS                                                                                                   | SYMBOL          | TYP | UNITS | NOTES |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------|-----------------|-----|-------|-------|
| Thermal Resistance (Junction to Ambient)     | Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA/JESD51. | θ <sub>JA</sub> | 40  | °C/W  | 4     |
| Thermal Resistance (Junction to Top of Case) |                                                                                                              | θ <sub>JC</sub> | 8   | °C/W  | 4     |

- NOTE:**
1. I<sub>DD</sub> is specified with no output current and increases with faster cycle times. I<sub>DDQ</sub> increases with faster cycle times and greater output loading.
  2. "Device deselected" means device is in power-down mode as defined in the truth table. "Device selected" means device is active (not in power-down mode).
  3. Typical values are measured at 3.3V, 25°C and 10ns cycle time.
  4. This parameter is sampled.

**ELECTRICAL CHARACTERISTICS AND RECOMMENDED AC OPERATING CONDITIONS**

 (Note 1) ( $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$ ;  $V_{DD}, V_{DDQ} = +3.3\text{V} \pm 0.3\text{V}/-0.165\text{V}$ )

| DESCRIPTION                             | SYMBOL            | -6  |     | -7.5 |     | -10 |     | UNITS | NOTES      |

- NOTE:**
1. Test conditions as specified with the output loading shown in Figure 1 unless otherwise noted.
  2. Measured as HIGH above  $V_{IH}$  and LOW below  $V_{IL}$ .
  3. This parameter is measured with the output loading shown in Figure 2.
  4. This parameter is sampled.
  5. Transition is measured  $\pm 500\text{mV}$  from steady state voltage.
  6. Refer to Technical Note TN-58-09, "Synchronous SRAM Bus Contention Design Considerations," for a more thorough discussion on these parameters.
  7. OE# is a "Don't Care" when a byte write enable is sampled LOW.
  8. A WRITE cycle is defined by at least one byte write enable LOW and ADSP# HIGH for the required setup and hold times. A READ cycle is defined by all byte write enables HIGH and ADSC# or ADV# LOW or ADSP# LOW for the required setup and hold times.
  9. This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK when either ADSP# or ADSC# is LOW and chip enabled. All other synchronous inputs must meet the setup and hold times with stable logic levels for all rising edges of clock (CLK) when the chip is enabled. Chip enable must be valid at each rising edge of CLK when either ADSP# or ADSC# is LOW to remain enabled.

## AC TEST CONDITIONS

|                                     |                                |
|-------------------------------------|--------------------------------|
| Input pulse levels .....            | $V_{IH} = (V_{DD}/2.2) + 1.5V$ |
| .....                               | $V_{IL} = (V_{DD}/2.2) - 1.5V$ |
| Input rise and fall times .....     | 1ns                            |
| Input timing reference levels ..... | $V_{DD}/2.2$                   |
| Output reference levels .....       | $V_{DDQ}/2.2$                  |
| Output load .....                   | See Figures 1 and 2            |

## LOAD DERATING CURVES

Micron 64K x 18, 32K x 32, or 32K x 36 SyncBurst SRAM timing is dependent upon the capacitive loading on the outputs.

Consult the factory for copies of I/O current versus voltage curves.

## Output Load Equivalent

**Figure 1**

**Figure 2**

## SNOOZE MODE

SNOOZE MODE is a low-current, “power-down” mode in which the device is deselected and current is reduced to  $I_{SB2Z}$ . The duration of SNOOZE MODE is dictated by the length of time the ZZ pin is in a HIGH state. After the device enters SNOOZE MODE, all inputs except ZZ become gated inputs and are ignored.

The ZZ pin is an asynchronous, active HIGH input that causes the device to enter SNOOZE MODE. When the ZZ pin becomes a logic HIGH,  $I_{SB2Z}$  is guaranteed after the setup time  $t_{ZZ}$  is met. Any READ or WRITE operation pending when the device enters SNOOZE MODE is not guaranteed to complete successfully. Therefore, SNOOZE MODE must not be initiated until valid pending operations are completed.

## SNOOZE MODE ELECTRICAL CHARACTERISTICS

| DESCRIPTION                        | CONDITIONS       | SYMBOL     | MIN         | MAX         | UNITS | NOTES |
|------------------------------------|------------------|------------|-------------|-------------|-------|-------|
| Current during SNOOZE MODE         | $ZZ \geq V_{IH}$ | $I_{SB2Z}$ |             | 10          | mA    |       |
| ZZ active to input ignored         |                  | $t_{ZZ}$   |             | $2(t_{KC})$ | ns    | 1     |
| ZZ inactive to input sampled       |                  | $t_{RZZ}$  | $2(t_{KC})$ |             | ns    | 1     |
| ZZ active to snooze current        |                  | $t_{ZZI}$  |             | $2(t_{KC})$ | ns    | 1     |
| ZZ inactive to exit snooze current |                  | $t_{RZZI}$ | 0           |             | ns    | 1     |

**NOTE:** 1. This parameter is sampled.

- NOTE:**
1. Q(A2) refers to output from address A2. Q(A2 + 1) refers to output from the next internal burst address following A2.
  2. CE2# and CE2 have timing identical to CE#. On this diagram, when CE# is LOW, CE2# is LOW and CE2 is HIGH. When CE# is HIGH, CE2# is HIGH and CE2 is LOW.
  3. Timing is shown assuming that the device was not enabled before entering into this sequence. OE# does not cause Q to be driven until after the following clock rising edge.
  4. Outputs are disabled within one clock cycle after deselect.

- NOTE:**
1. D(A2) refers to input for address A2. Q(A2 + 1) refers to input for the next internal burst address following A2.
  2. CE2# and CE2 have timing identical to CE#. On this diagram, when CE# is LOW, CE2# is LOW and CE2 is HIGH. When CE# is HIGH, CE2# is HIGH and CE2 is LOW.
  3. OE# must be HIGH before the input data setup and held HIGH throughout the data hold time. This prevents input/output data contention for the time period prior to the byte write enable inputs being sampled.
  4. ADV# must be HIGH to permit a WRITE to the loaded address.
  5. Full-width WRITE can be initiated by GW# LOW; or GW# HIGH and BWE#, BWA# and BWb# LOW for x18 device; or GW# HIGH and BWE#, BWA#-BWD# LOW for x32 and x36 devices.

## READ/WRITE TIMING

- NOTE:**
1. Q(A4) refers to output from address A4. Q(A4 + 1) refers to output from the next internal burst address following A4.
  2. CE2# and CE2 have timing identical to CE#. On this diagram, when CE# is LOW, CE2# is LOW and CE2 is HIGH. When CE# is HIGH, CE2# is HIGH and CE2 is LOW.
  3. The data bus (Q) remains in High-Z following a WRITE cycle unless an ADSP#, ADSC# or ADV# cycle is performed.
  4. GW# is HIGH.
  5. Back-to-back READs may be controlled by either ADSP# or ADSC#.

**100-PIN PLASTIC TQFP (JEDEC LQFP)**

- NOTE:** 1. All dimensions in millimeters  $\frac{\text{MAX}}{\text{MIN}}$  or typical where noted.  
2. Package width and length do not include mold protrusion; allowable mold protrusion is .01" per side.

**DATA SHEET DESIGNATIONS**

No Marking: This data sheet contains minimum and maximum limits specified over the complete power supply and temperature range for production devices. Although considered final, these specifications are subject to change, as further product development and data characterization sometimes occur.
