

Quad Single Supply Comparators

These comparators are designed for use in level detection, low-level sensing and memory applications in consumer automotive and industrial electronic applications.

- Single or Split Supply Operation
- Low Input Bias Current: 25 nA (Typ)
- Low Input Offset Current: ± 5.0 nA (Typ)
- Low Input Offset Voltage: ± 1.0 mV (Typ) LM139A Series
- Input Common Mode Voltage Range to Gnd
- Low Output Saturation Voltage: 130 mV (Typ) @ 4.0 mA
- TTL and CMOS Compatible
- ESD Clamps on the Inputs Increase Reliability without Affecting Device Operation

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Power Supply Voltage LM139, A/LM239, A/LM339A/LM2901 MC3302	V_{CC}	+36 or ± 18 +30 or ± 15	Vdc
Input Differential Voltage Range LM139, A/LM239, A/LM339, A/LM2901 MC3302	V_{IDR}	36 30	Vdc
Input Common Mode Voltage Range	V_{ICMR}	-0.3 to V_{CC}	Vdc
Output Short Circuit to Ground (Note 1)	I_{SC}	Continuous	
Input Current ($V_{in} < -0.3$ Vdc) (Note 2)	I_{in}	50	mA
Power Dissipation @ $T_A = 25^\circ\text{C}$ Ceramic Plastic Package Derate above 25°C	P_D	1.0 8.0	W mW/ $^\circ\text{C}$
Junction Temperature Ceramic & Metal Package Plastic Package	T_J	175 150	$^\circ\text{C}$
Operating Ambient Temperature Range LM139, A LM239, A MC3302 LM2901 LM339, A	T_A	-55 to $+125$ -25 to $+85$ -40 to $+85$ -40 to $+105$ 0 to $+70$	$^\circ\text{C}$
Storage Temperature Range	T_{stg}	-65 to $+150$	$^\circ\text{C}$

- NOTES:**
- The maximum output current may be as high as 20 mA, independent of the magnitude of V_{CC} . Output short circuits to V_{CC} can cause excessive heating and eventual destruction.
 - This magnitude of input current will only occur if the leads are driven more negative than ground or the negative supply voltage. This is due to the input PNP collector-base junction becoming forward biased, acting as an input clamp diode. There is also a lateral PNP parasitic transistor action which can cause the output voltage of the comparators to go to the V_{CC} voltage level (or ground if overdrive is large) during the time that an input is driven negative. This will not destroy the device when limited to the max rating and normal output states will recover when the inputs become $\geq$ ground or negative supply.
 - (LM139/139A) $T_{LOW} = -55^\circ\text{C}$, $T_{HIGH} = +125^\circ\text{C}$
(LM239/239A) $T_{LOW} = -25^\circ\text{C}$, $T_{HIGH} = +85^\circ\text{C}$
(MC3302) $T_{LOW} = -40^\circ\text{C}$, $T_{HIGH} = +105^\circ\text{C}$
(LM2901) $T_{LOW} = -40^\circ\text{C}$, $T_{HIGH} = +105^\circ\text{C}$
 - At the output switch point, $V_O \approx 1.4$ Vdc, $R_S \leq 100 \Omega$, 5.0 Vdc $\leq V_{CC} \leq 30$ Vdc, with the inputs over the full common mode range (0 Vdc to $V_{CC} - 1.5$ Vdc).
 - The bias current flows out of the inputs due to the PNP input stage. This current is virtually constant, independent of the output state.
 - The response time specified is for a 100 mV input step with 5.0 mV overdrive. For larger signals, 300 ns is typical.

APPLICATIONS INFORMATION

These quad comparators feature high gain, wide bandwidth characteristics. This gives the device oscillation tendencies if the outputs are capacitively coupled to the inputs via stray capacitance. This oscillation manifests itself during output transitions (V_{OL} to V_{OH}). To alleviate this situation input resistors $< 10 \text{ k}\Omega$ should be used. The addition of positive

feedback ($< 10 \text{ mV}$) is also recommended. It is good design practice to ground all unused input pins. Differential input voltages may be larger than supply voltages without damaging the comparator's inputs. Voltages more negative than -300 mV should not be used.
