## **PCA9553**

4-bit I<sup>2</sup>C LED driver with programmable  
blink rates

Preliminary data

2002 Sep 03

# 4-bit I<sup>2</sup>C LED driver with programmable blink rates

PCA9553

## FEATURES

- 4 LED drivers (on, off, flashing at a programmable rate)
- 2 selectable, fully programmable blink rates (frequency and duty cycle) between 0.15625 and 40 Hz (6.4 and 0.025 seconds)
- Input/outputs not used as LED drivers can be used as regular GPIOs
- Internal oscillator requires no external components
- I<sup>2</sup>C interface logic compatible with SMBus
- Internal power-on reset
- Noise filter on SCL/SDA inputs
- 4 open drain outputs directly drive LEDs to 25 mA
- Controlled edge rates to minimize ground bounce
- No glitch on power-up
- Supports hot insertion
- Low stand-by current
- Operating power supply voltage range of 2.3 V to 5.5 V
- 0 to 400 kHz clock frequency
- ESD protection exceeds 2000 V HBM per JESD22-A114, 150 V MM per JESD22-A115 and 1000 V CDM per JESD22-C101
- Latch-up testing is done to JEDEC Standard JESD78 which exceeds 100 mA
- Package offer: SO8, TSSOP8

## DESCRIPTION

The PCA9553 LED Blinker blinks LEDs in I<sup>2</sup>C and SMBus applications where it is necessary to limit bus traffic or free up the I<sup>2</sup>C Master's (MCU, MPU, DSP, chipset, etc.) timer. The uniqueness of this device is the internal oscillator with two programmable blink rates. To blink LEDs using normal I/O Expanders like the PCF8574 or PCA9554, the bus master must send repeated commands to turn the LED on and off. This greatly increases the amount of traffic on the I<sup>2</sup>C bus and uses up one of the master's timers. The PCA9553 LED Blinker instead requires only the initial set up command to program BLINK RATE 1 and BLINK RATE 2 (i.e., the frequency and duty cycle). From then on, only one command from the bus master is required to turn each individual open drain output ON, OFF, or to cycle at BLINK RATE 1 or BLINK RATE 2. Maximum output sink current is 25 mA per bit and 100 mA per package.

Any bits not used for controlling the LEDs can be used for General Purpose Parallel Input/Output (GPIO) expansion.

Power On Reset (POR) initializes the registers to their default state, all zeroes, causing the bits to be set high (LED off).

Due to pin limitations, the PCA9553 is not featured with hardware address pins. The PCA9553-1 and the PCA9553-2 have different fixed I<sup>2</sup>C addresses allowing operation of both on the same bus.

## PIN CONFIGURATION

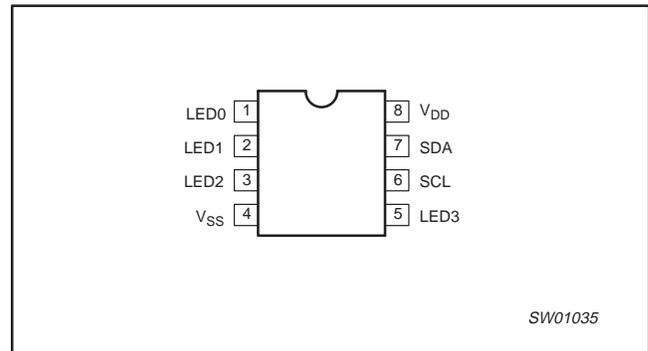

Figure 1. Pin configuration

## PIN DESCRIPTION

| PIN NUMBER | SYMBOL          | FUNCTION          |
|------------|-----------------|-------------------|
| 1          | LED0            | LED driver 0      |
| 2          | LED1            | LED driver 1      |
| 3          | LED2            | LED driver 2      |
| 4          | V <sub>SS</sub> | Supply ground     |
| 5          | LED3            | LED driver 3      |
| 6          | SCL             | Serial clock line |
| 7          | SDA             | Serial data line  |
| 8          | V <sub>DD</sub> | Supply voltage    |

# PCA9553

## DEVICE ADDRESSING

Following a START condition the bus master must output the address of the slave it is accessing. The address of the PCA9553-1 is shown in Figure 3 and PCA9553-2 in Figure 4.

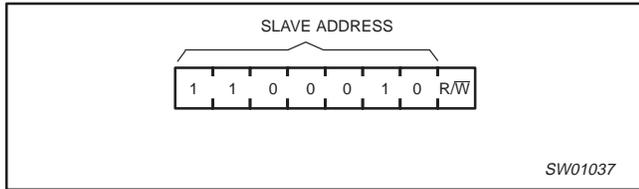

Figure 3. Slave address — PCA9553-1

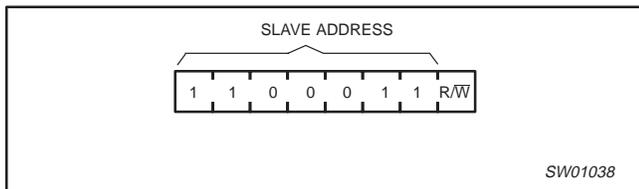

Figure 4. Slave address — PCA9553-2

The last bit of the address byte defines the operation to be performed. When set to logic 1 a read is selected while a logic 0 selects a write operation.

## CONTROL REGISTER

Following the successful acknowledgement of the slave address, the bus master will send a byte to the PCA9553 which will be stored in the Control Register.

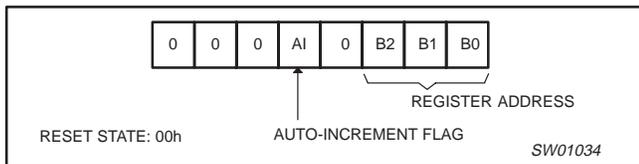

Figure 5. Control register

## CONTROL REGISTER DEFINITION

| B2 | B1 | B0 | REGISTER NAME | TYPE        | REGISTER FUNCTION     |
|----|----|----|---------------|-------------|-----------------------|
| 0  | 0  | 0  | INPUT         | READ        | INPUT REGISTER        |
| 0  | 0  | 1  | PSC0          | READ/ WRITE | FREQUENCY PRESCALER 0 |
| 0  | 1  | 0  | PWM0          | READ/ WRITE | PWM REGISTER 0        |
| 0  | 1  | 1  | PSC1          | READ/ WRITE | FREQUENCY PRESCALER 1 |
| 1  | 0  | 0  | PWM1          | READ/ WRITE | PWM REGISTER 1        |
| 1  | 0  | 1  | LS0           | READ/ WRITE | LED SELECTOR          |

## REGISTER DESCRIPTION

The lowest 3 bits are used as a pointer to determine which register will be accessed.

If the auto-increment flag is set, the three low order bits of the Control Register are automatically incremented after a read or write. This allows the user to program the registers sequentially. The

contents of these bits will rollover to '000' after the last register is accessed.

When auto-increment flag is set (AI = 1) and a read sequence is initiated, the sequence must start by reading a register different from 0 (B2 B1 B0 ≠ 0 0 0)

Only the 3 least significant bits are affected by the AI flag.

Unused bits must be programmed with zeroes.

### INPUT — INPUT REGISTER

| bit     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| Default | X | X | X | X | X | X | X | X |

The INPUT register reflects the state of the device pins. Writes to this register will be acknowledged but will have no effect.

### PSC0 — FREQUENCY PRESCALER 0

| bit     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| default | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

PSC0 is used to program the period of the PWM output.

$$\text{The period of BLINK0} = \frac{(PSC0 + 1)}{38}$$

### PWM0 — PWM REGISTER 0

| bit     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The PWM0 register determines the duty cycle of BLINK0. The outputs are LOW (LED off) when the count is less than the value in PWM0 and HIGH when it is greater. If PWM0 is programmed with 00h, then the PWM0 output is always LOW.

$$\text{The duty cycle of BLINK0 is: } \frac{256 - PWM0}{256}$$

### PSC1 — FREQUENCY PRESCALER 1

| bit     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| default | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

PSC1 is used to program the period of PWM output.

$$\text{The period of BLINK1} = \frac{(PSC1 + 1)}{38}$$

### PWM1 — PWM REGISTER 1

| bit     | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The PWM1 register determines the duty cycle of BLINK1. The outputs are LOW (LED off) when the count is less than the value in PWM1 and HIGH when it is greater. If PWM1 is programmed with 00h, then the PWM1 output is always LOW.

$$\text{The duty cycle of BLINK1 is: } \frac{256 - PWM1}{256}$$

### LS0 — LED SELECTOR

|         | LED3 | LED2 | LED 1 | LED 0 |   |   |   |   |
|---------|------|------|-------|-------|---|---|---|---|
| bit     | 7    | 6    | 5     | 4     | 3 | 2 | 1 | 0 |
| default | 0    | 1    | 0     | 1     | 0 | 1 | 0 | 1 |

The LSx LED select registers determine the source of the LED data.

- 00 = Output is set low (LED on)
- 01 = Output is set Hi-Z (LED off – default)
- 10 = Output blinks at PWM0 rate
- 11 = Output blinks at PWM1 rate

# 4-bit I<sup>2</sup>C LED driver with programmable blink rates

# PCA9553

## POWER-ON RESET

When power is applied to V<sub>DD</sub>, an internal Power On Reset holds the PCA9553 in a reset state until V<sub>DD</sub> has reached V<sub>POR</sub>. At this point, the reset condition is released and the PCA9553 registers are initialized to their default states, with all outputs in the off state.

## CHARACTERISTICS OF THE I<sup>2</sup>C-BUS

The I<sup>2</sup>C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

## Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see Figure 6).

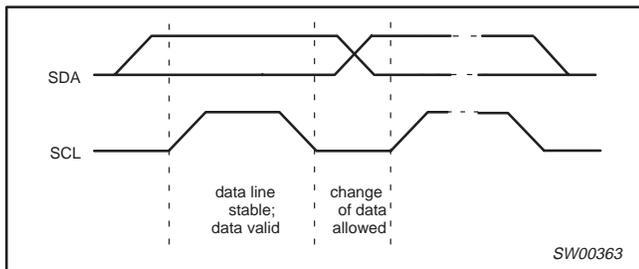

Figure 6. Bit transfer

## Start and stop conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the start condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the stop condition (P) (see Figure 7).

## System configuration

A device generating a message is a transmitter: a device receiving is the receiver. The device that controls the message is the master and the devices which are controlled by the master are the slaves (see Figure 8).

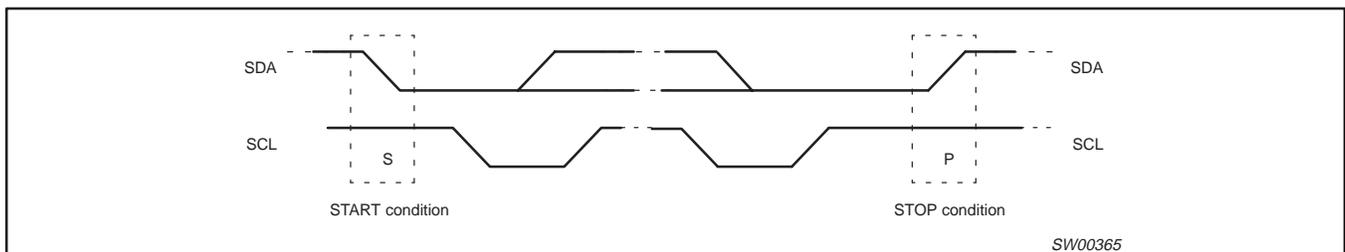

Figure 7. Definition of start and stop conditions

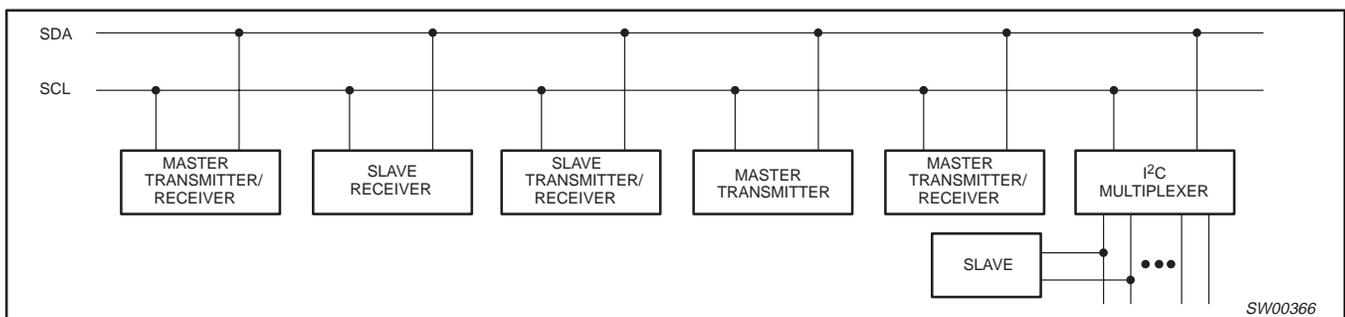

Figure 8. System configuration

# 4-bit I<sup>2</sup>C LED driver with programmable blink rates

# PCA9553

## Acknowledge

The number of data bytes transferred between the start and the stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter whereas the master generates an extra acknowledge related clock pulse.

A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse, set-up and hold times must be taken into account.

A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a stop condition.

## APPLICATION DATA

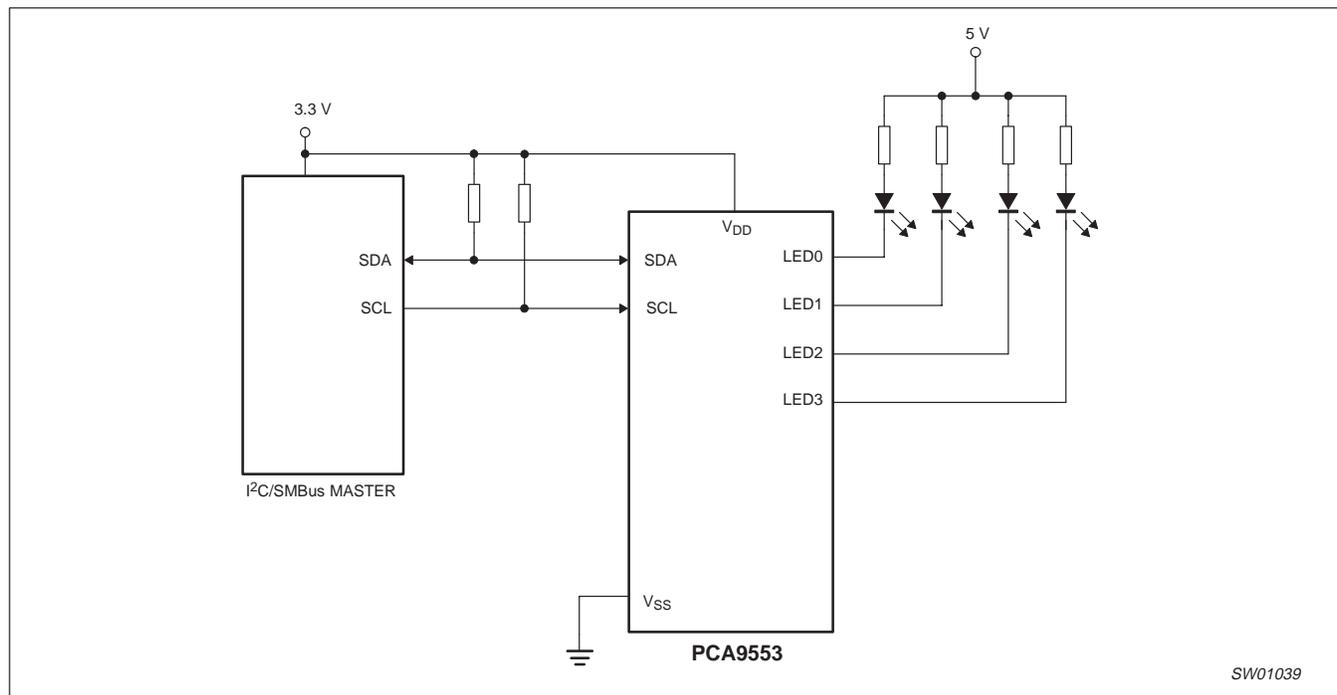

Figure 13. Typical application

4-bit I<sup>2</sup>C LED driver with programmable blink rates

PCA9553

**Programming example**

The following example will show how to set LED0 and LED1 off. It will then set LED2 to blink at 1 Hz, 50% duty cycle. LED3 will be set to blink at 4 Hz, 25% duty cycle. PCA9553-1 is used in this example.

**Table 1.**

|  | I <sup>2</sup> C-bus |
|--|----------------------|
| Start  | S                    |
| PCA9553 address  | C4h                  |
| PSC0 subaddress + auto-increment   | 11h                  |
| Set prescaler PSC0 to achieve a period of 1 second:<br>$\text{Blink period} = 1 = \frac{\text{PSC0} + 1}{38}$ $\text{PSC0} = 37$       | 25h                  |
| Set PWM0 duty cycle to 50%:<br>$\frac{256 - \text{PWM0}}{256} = 0.5$ $\text{PWM0} = 128$   | 80h                  |
| Set prescaler PWM1 to achieve a period of 0.25 seconds:<br>$\text{Blink period} = 0.25 = \frac{\text{PSC1} + 1}{38}$ $\text{PSC1} = 9$ | 09h                  |
| Set PWM1 output duty cycle to 25%:<br>$\frac{256 - \text{PWM1}}{256} = 0.25$ $\text{PWM1} = 192$                                       | C0h                  |
| Set LED0 on, LED1 off, LED2 set to blink at PSC0, PWM0, LED3 set to blink at PCS1, PWM1  | E4h                  |
| Stop   | P                    |

**ABSOLUTE MAXIMUM RATINGS**

In accordance with the Absolute Maximum Rating System (IEC 134)

| SYMBOL           | PARAMETER                     | CONDITIONS | MIN                   | MAX  | UNIT |
|------------------|-------------------------------|------------|-----------------------|------|------|
| V <sub>DD</sub>  | Supply voltage                |            | -0.5                  | 6.0  | V    |
| V <sub>I/O</sub> | DC voltage on an I/O          |            | V <sub>SS</sub> - 0.5 | 5.5  | V    |
| I <sub>I/O</sub> | DC output current on an I/O   |            | —                     | ±25  | mA   |
| I <sub>SS</sub>  | Supply current                |            | —                     | 100  | mA   |
| P <sub>tot</sub> | Total power dissipation       |            | —                     | 400  | mW   |
| T <sub>stg</sub> | Storage temperature range     |            | -65                   | +150 | °C   |
| T <sub>amb</sub> | Operating ambient temperature |            | -40                   | +85  | °C   |

**HANDLING**

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take precautions appropriate to handling MOS devices. Advice can be found in Data Handbook IC24 under "Handling MOS devices".

**DC CHARACTERISTICS**V<sub>DD</sub> = 2.3 to 5.5 V; V<sub>SS</sub> = 0 V; T<sub>amb</sub> = -40 to +85 °C; unless otherwise specified. TYP at 3.3 V and 25 °C.

## NOTES:

1. C<sub>b</sub> = total capacitance of one bus line in pF.
2. t<sub>VD;ACK</sub> = time for Acknowledgement signal from SCL low to SDA (out) low.
3. t<sub>VD;DAT</sub> = minimum time for SDA data out to be valid following SCL low.

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips. This specification can be ordered using the code 9398 393 40011.

## Data sheet status

| Data sheet status <sup>[1]</sup> | Product status <sup>[2]</sup> | Definitions  |
|----------------------------------|-------------------------------|--|
| Objective data                   | Development                   | This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.  |
| Preliminary data                 | Qualification                 | This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.                                     |
| Product data                     | Production                    | This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Changes will be communicated according to the Customer Product/Process Change Notification (CPCN) procedure SNW-SQ-650A. |

[1] Please consult the most recently issued data sheet before initiating or completing a design.

[2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.

## Definitions

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

**Limiting values definition** — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

## Disclaimers

**Life support** — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

**Right to make changes** — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
