

**LS290-DECADE COUNTER**  
**LS293-4-BIT BINARY COUNTER**

- CORNER POWER PIN VERSION OF THE LS90 AND LS93
- LOW POWER CONSUMPTION... TYPICALLY 45mW
- HIGH COUNT RATES... TYPICALLY 50MHZ
- CHOICE OF COUNTING MODES... BCD, BI-QUINARY, BINARY
- INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS
- FULLY TTL AND CMOS COMPATIBLE

**DESCRIPTION**

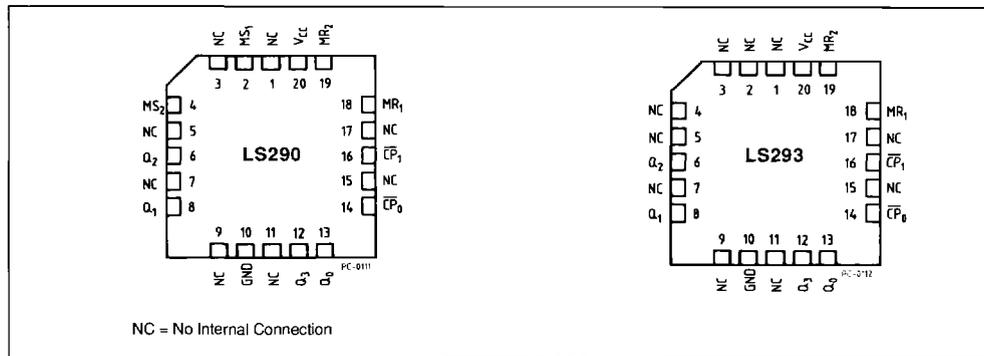

The T74LS290 and T74LS293 are high-speed 4-bit ripple type counters partitioned into two sections. Each counter has a divide-by-two section and either a divide-by-five (LS290) or divided-by-eight (LS293) section which are triggered by a HIGH-to-LOW transition on the clock inputs. Each section can be used separately or tied together (Q to  $\overline{CP}$ ) to form BCD, Bi-quinary, or Modulo-16 counters. Both of the counters have a 2-input gated Master Reset (Clear), and the LS90 also has a 2-input gated Master Set (Preset 9).

I <sub>O</sub>	Output Current, into Outputs	50	mA

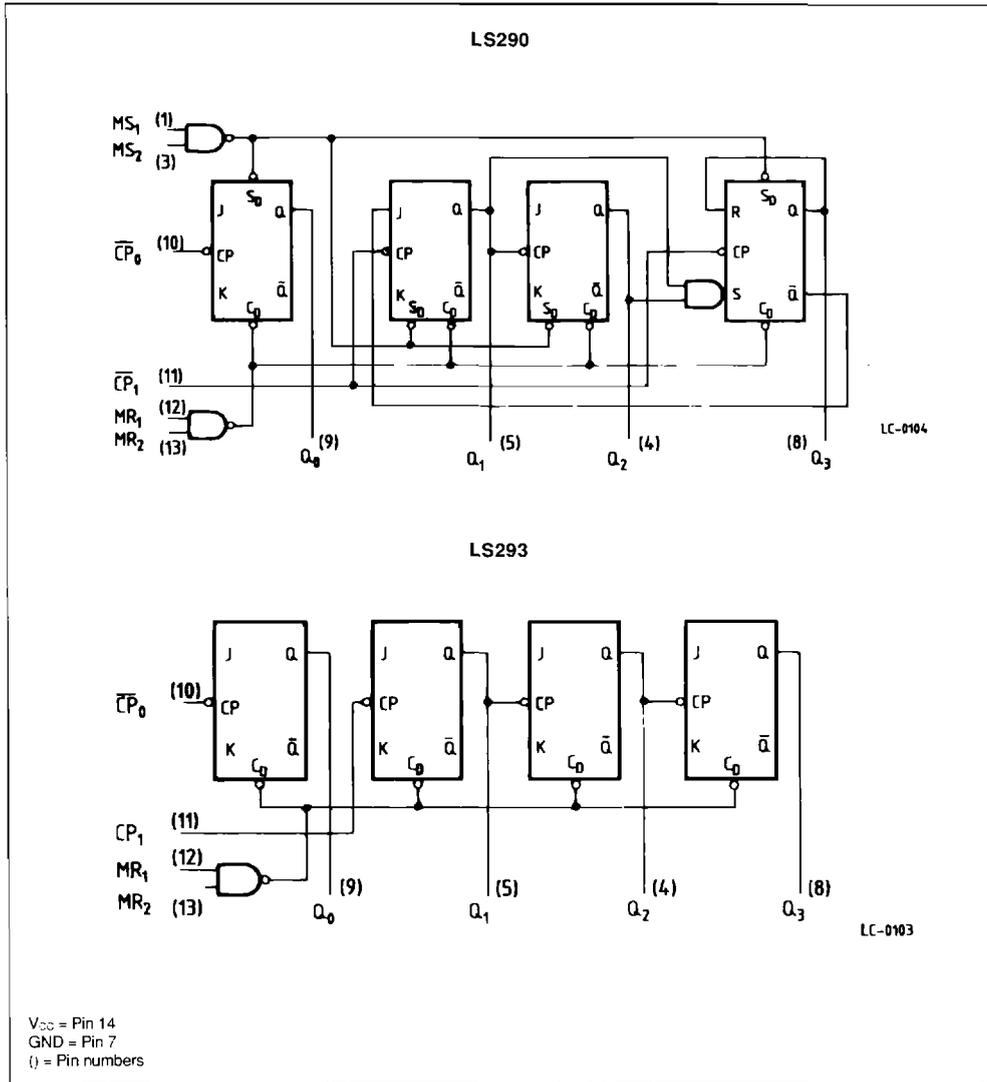

Stresses in excess of those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions in excess of those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## LOGIC SYMBOL

## FUNCTIONAL DESCRIPTION

The LS290 and LS293 are 4-bit ripple Decade, and 4-bit Binary counters respectively. Each device consists of four master/slave flip-flops which are internally connected to provide a divide-by-two section and divide-by-five (LS290) or divide-by-eight (LS293) section. Each section has a separate clock input which initiates state changes of the counter on the HIGH-to-LOW clock transition. State changes of the Q outputs do not occur simultaneously because of internal ripple delays. Therefore, decoded output signals are subject to decoding spikes and should not be used for clocks or strobes. The  $Q_0$  output of each device is designed and specified to drive the rated fan-out plus the  $\overline{CP}_1$  input of device.

A gated AND asynchronous Master Reset ( $MR_1, MS_2$ ) is provided on both counters which overrides the clocks and resets (clears) all the flip-flops. A gated AND asynchronous master Set ( $MS_1, MS_2$ ) is provided on the LS290 which overrides the clocks and the MR inputs and sets the outputs to nine (HLLH).

Since the output from the divide-by-two section is not internally connected to the succeeding stages, the devices may be operated in various counting modes :

**LS290**

- A. BCD Decade (8421) Counter-the  $\overline{CP}_1$  input must be externally connected to the  $Q_0$  output. The  $CP_0$  input receives the incoming count and BCD count sequence is produced.

- B. Symmetrical Bi-quinary Divide-By-Ten Counter -The  $Q_3$  output must be externally connected to the  $CP_0$  input. The input count is then applied to the  $CP_1$  input and a divide-by-ten square is obtained at output  $Q_0$ .

- C. Divide-By-Two and Divide-By-Five Counter- No external interconnections are required. The first flip-flop is used as a binary element for the divide-by-two functions ( $\overline{CP}_0$  as the input and  $Q_0$  as the output). The  $\overline{CP}_1$  input is used to obtain binary divide-by-five operation at the  $Q_3$  output.

**LS293**

- A. 4-Bit Ripple Counter-The output  $Q_0$  must be externally connected to input  $\overline{CP}_1$ . The input count pulses are applied to input  $\overline{CP}_0$ . Simultaneous division of 2, 4, 8, and 16 are performed at the  $Q_0, Q_1, Q_2,$  and  $Q_3$  outputs as shown in the truth table.
- B. 3-Bit Ripple Counter-The input count pulses are applied to input  $CP_1$ . Simultaneous frequency divisions of 2, 4, and 8 are available at the  $Q_0, Q_1, Q_2,$  and  $Q_3$  outputs. Independent of the first flip-flop is available if the reset function coincides with reset of the 3-bit ripple-through counter.
