

NDS352AP**P-Channel Logic Level Enhancement Mode Field Effect Transistor****General Description**

These P-Channel logic level enhancement mode power field effect transistors are produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance. These devices are particularly suited for low voltage applications such as notebook computer power management, portable electronics, and other battery powered circuits where fast high-side switching, and low in-line power loss are needed in a very small outline surface mount package.

Features

- -0.9 A, -30 V. $R_{DS(ON)} = 0.5 \Omega @ V_{GS} = -4.5 V$
 $R_{DS(ON)} = 0.3 \Omega @ V_{GS} = -10 V$.
- Industry standard outline SOT-23 surface mount package using proprietary SuperSOT™-3 design for superior thermal and electrical capabilities.
- High density cell design for extremely low $R_{DS(ON)}$.
- Exceptional on-resistance and maximum DC current capability.

Notes:

1. $R_{\text{th}}^{\text{JC}}$ is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{\text{th}}^{\text{CA}}$ is guaranteed by design while $R_{\text{th},A}$ is determined by the user's board design.

$$P_D(t) = \frac{T_J - T_A}{R_{\text{th},JA}(t)} = \frac{T_J - T_A}{R_{\text{th},JC} + R_{\text{th},CA}(t)} = I_D^2(t) \times R_{\text{DS(ON)}@T_J}$$

Typical $R_{\text{th},JA}$ using the board layouts shown below on 4.5" x 5" FR-4 PCB in a still air environment:

- a. 250°C/W when mounted on a 0.02 in² pad of 2oz copper.
 b. 270°C/W when mounted on a 0.001 in² pad of 2oz copper.
