

## Features

- High Performance, Low Power AVR®32 UC 32-Bit Microcontroller
  - Compact Single-cycle RISC Instruction Set Including DSP Instruction Set
  - Read-Modify-Write Instructions and Atomic Bit Manipulation
  - Up to 66 MHz Clock Frequency with 1.24 DMIPS/MHz
  - Memory Protection Unit
- Multi-hierarchy Bus System
  - High-Performance Data Transfers on Separate Buses for Increased Performance
  - 15 Peripheral DMA Channels for Automatic Data Transfer
- Internal High-Speed Flash
  - 512K Bytes, 256K Bytes, 128K Bytes Versions
  - Single Cycle Access up to 30 MHz
  - Prefetch Buffer Optimizing Instruction Execution at Maximum Speed
  - 1ms Page Programming Time and 2ms Full-Chip Erase Time
  - 100,000 Write Cycles, 10-year Data Retention Capability
  - Flash Security Locks and User Defined Configuration Area
- Internal High-Speed SRAM, Single-Cycle Access at Full Speed
  - 64K Bytes (512KB and 256KB Flash), 32K Bytes (128KB Flash)
- External Memory Interface on AT32UC3A0 Derivatives
  - SDRAM / SRAM Compatible Memory Bus (16-bit Data and 24-bit Address Buses)
- Interrupt Controller
  - Autovectored Low Latency Interrupt Service with Programmable Priority
- System Functions
  - Power and Clock Manager Including Internal RC Clock and One 32KHz Oscillator
  - Two Multipurpose Oscillators and Two Phase-Lock-Loop (PLL)
  - Watchdog Timer, Real-Time Clock Timer
- Universal Serial Bus (USB)
  - Device 2.0 Full Speed and On-The-Go (OTG) Low Speed and Full Speed
  - Flexible End-Point Configuration and Management with Dedicated DMA Channels
  - On-chip Transceivers Including Pull-Ups
- Ethernet MAC 10/100 Mbps interface
  - 802.3 Ethernet Media Access Controller
  - Supports Media Independent Interface (MII) and Reduced MII (RMII)
- One Three-Channel 16-bit Timer/Counter (TC)
  - Three External Clock Inputs, PWM, Capture and Various Counting Capabilities
- One 7-Channel 16-bit Pulse Width Modulation Controller (PWM)
- Four Universal Synchronous/Asynchronous Receiver/Transmitters (USART)
  - Independant Baudrate Generator, Support for IrDA and ISO7816 interfaces
  - Support for Hardware Handshaking, RS485 Interfaces and Modem Line
- Two Master/Slave Serial Peripheral Interfaces (SPI) with Chip Select Signals
- One Synchronous Serial Protocol Controller
  - Supports I2S and Generic Frame-Based Protocols
- One Master/Slave Two-Wire Interface (TWI), 400kbit/s I2C-compatible
- One 8-channel 10-bit Analog-To-Digital Converter
- On-Chip Debug System (JTAG interface)
  - Nexus Class 2+, Runtime Control, Non-Intrusive Data and Program Trace
- 100-pin TQFP (69 GPIO pins), 144-pin LQFP (109 GPIO pins)
- 5V Input Tolerant I/Os
- Single 3.3V Power Supply

## Preliminary

## Summary

## 1. Description

The AT32UC3A is a complete System-On-Chip microcontroller based on the AVR32 UC RISC processor running at frequencies up to 66 MHz. AVR32 UC is a high-performance 32-bit RISC microprocessor core, designed for cost-sensitive embedded applications, with particular emphasis on low power consumption, high code density and high performance.

The processor implements a Memory Protection Unit (MPU) and a fast and flexible interrupt controller for supporting modern operating systems and real-time operating systems. Higher computation capabilities are achievable using a rich set of DSP instructions.

The AT32UC3A incorporates on-chip Flash and SRAM memories for secure and fast access. For applications requiring additional memory, an external memory interface is provided on AT32UC3A0 derivatives.

The Peripheral Direct Memory Access controller enables data transfers between peripherals and memories without processor involvement. PDCA drastically reduces processing overhead when transferring continuous and large data streams between modules within the MCU.

The PowerManager improves design flexibility and security: the on-chip Brown-Out Detector monitors the power supply, the CPU runs from the on-chip RC oscillator or from one of external oscillator sources, a Real-Time Clock and its associated timer keeps track of the time.

The Timer/Counter includes three identical 16-bit timer/counter channels. Each channel can be independently programmed to perform frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

The PWM modules provides seven independent channels with many configuration options including polarity, edge alignment and waveform non overlap control. One PWM channel can trigger ADC conversions for more accurate close loop control implementations.

The AT32UC3A also features many communication interfaces for communication intensive applications. In addition to standard serial interfaces like UART, SPI or TWI, other interfaces like flexible Synchronous Serial Controller, USB and Ethernet MAC are available.

The Synchronous Serial Controller provides easy access to serial communication protocols and audio standards like I2S.

The Full-Speed USB 2.0 Device interface supports several USB Classes at the same time thanks to the rich End-Point configuration. The On-The-GO (OTG) Host interface allows device like a USB Flash disk or a USB printer to be directly connected to the processor.

The media-independent interface (MII) and reduced MII (RMII) 10/100 Ethernet MAC module provides on-chip solutions for network-connected devices.

AT32UC3A integrates a class 2+ Nexus 2.0 On-Chip Debug (OCD) System, with non-intrusive real-time trace, full-speed read/write memory access in addition to basic runtime control.

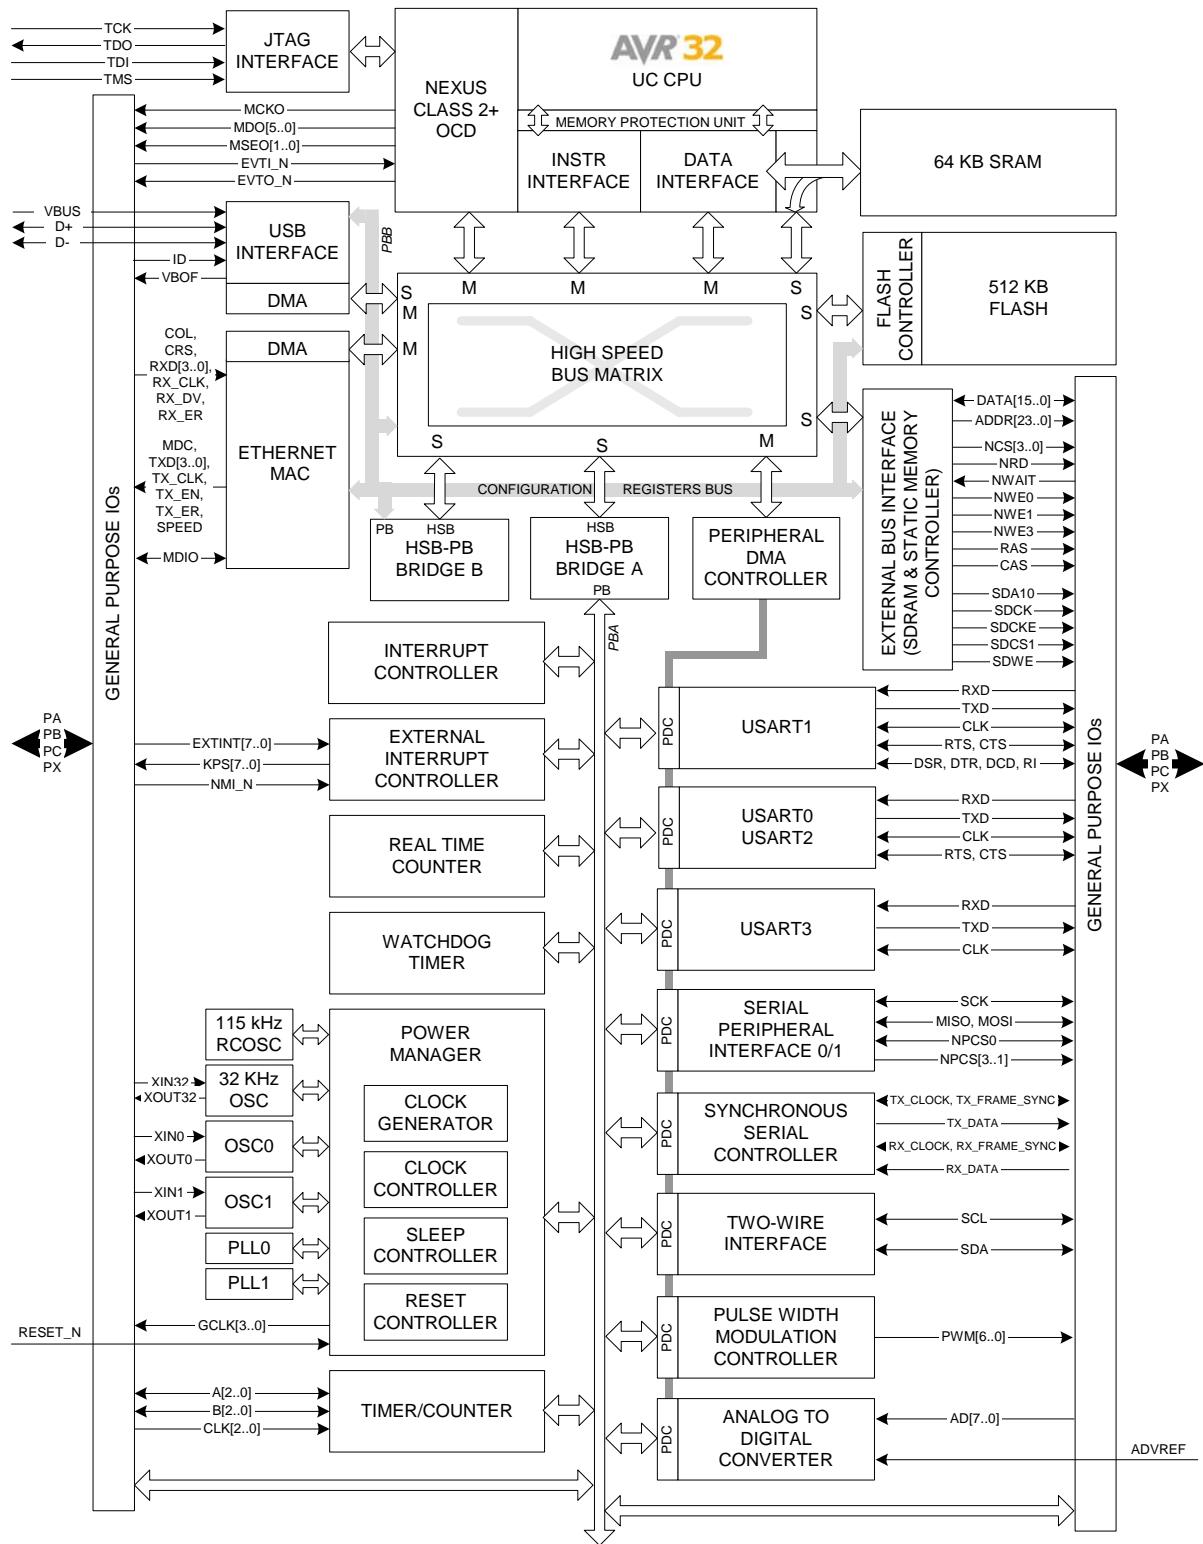

## 2. Configuration Summary

The table below lists all AT32UC3A memory and package configurations:

## 3.1 Processor and architecture

### 3.1.1 AVR32 UC CPU

- 32-bit load/store AVR32A RISC architecture.
  - 15 general-purpose 32-bit registers.
  - 32-bit Stack Pointer, Program Counter and Link Register reside in register file.
  - Fully orthogonal instruction set.
  - Privileged and unprivileged modes enabling efficient and secure Operating Systems.
  - Innovative instruction set together with variable instruction length ensuring industry leading code density.
  - DSP extention with saturating arithmetic, and a wide variety of multiply instructions.
- 3 stage pipeline allows one instruction per clock cycle for most instructions.
  - Byte, half-word, word and double word memory access.
  - Multiple interrupt priority levels.
- MPU allows for operating systems with memory protection.

### 3.1.2 Debug and Test system

- IEEE1149.1 compliant JTAG and boundary scan
- Direct memory access and programming capabilities through JTAG interface
- Extensive On-Chip Debug features in compliance with IEEE-ISTO 5001-2003 (Nexus 2.0) Class 2+
  - Low-cost NanoTrace supported.
- Auxiliary port for high-speed trace information
- Hardware support for 6 Program and 2 data breakpoints
- Unlimited number of software breakpoints supported
- Advanced Program, Data, Ownership, and Watchpoint trace supported

### 3.1.3 Peripheral DMA Controller

- Transfers from/to peripheral to/from any memory space without intervention of the processor.
- Next Pointer Support, forbids strong real-time constraints on buffer management.
- Fifteen channels
  - Two for each USART
  - Two for each Serial Synchronous Controller
  - Two for each Serial Peripheral Interface
  - One for each ADC
  - Two for each TWI Interface

### 3.1.4 Bus system

- High Speed Bus (HSB) matrix with 6 Masters and 6 Slaves handled
  - Handles Requests from the CPU Data Fetch, CPU Instruction Fetch, PDCA, USBB, Ethernet Controller, CPU SAB, and to internal Flash, internal SRAM, Peripheral Bus A, Peripheral Bus B, EBI.
  - Round-Robin Arbitration (three modes supported: no default master, last accessed default master, fixed default master)
  - Burst Breaking with Slot Cycle Limit
  - One Address Decoder Provided per Master

- Peripheral Bus A able to run on at divided bus speeds compared to the High Speed Bus

Figure 3-1 gives an overview of the bus system. All modules connected to the same bus use the same clock, but the clock to each module can be individually shut off by the Power Manager. The figure identifies the number of master and slave interfaces of each module connected to the High Speed Bus, and which DMA controller is connected to which peripheral.

## 4. Signals Description

The following table gives details on the signal name classified by peripheral

The signals are multiplexed with GPIO pins as described in "[Peripheral Multiplexing on I/O lines](#)" on page 25.

## 6. Power Considerations

### 6.1 Power Supplies

The AT32UC3A has several types of power supply pins:

- **VDDIO:** Powers I/O lines. Voltage is 3.3V nominal.
- **VDDANA:** Powers the ADC Voltage is 3.3V nominal.
- **VDDIN:** Input voltage for the voltage regulator. Voltage is 3.3V nominal.
- **VDDCORE:** Powers the core, memories, and peripherals. Voltage is 1.8V nominal.
- **VDDSYS:** Powers the PLL and ADC. Voltage is 1.8V nominal.

The ground pins GND are common to VDDCORE and VDDIO. The ground pin for VDDANA and VDDSYS is GNDANA.

See "[Electrical Characteristics](#)" on page 33 for power consumption on the various supply pins.

### 6.2 Voltage Regulator

The AT32UC3A embeds a voltage regulator that converts from 3.3V to 1.8V with a load of up to 100 mA. The regulator takes its input voltage from VDDIN, and supplies the output voltage on VDDOUT. VDDOUT should be externally connected to the 1.8V domains to be powered.

Adequate output supply decoupling is mandatory for VDDOUT to reduce ripple and avoid oscillations. The best way to achieve this is to use two capacitors in parallel: one external 470 pF (or 1 nF) NPO capacitor should be connected between VDDOUT and GND as close to the chip as possible. One external 2.2 µF (or 3.3 µF) X7R capacitor should be connected between VDDOUT and GND.

Adequate input supply decoupling is mandatory for VDDIN in order to improve startup stability and reduce source voltage drop. The input decoupling capacitor should be placed close to the chip. For example, two capacitors can be used in parallel: 100 nF NPO and 4.7 µF X7R.

## 7. I/O Line Considerations

### 7.1 JTAG pins

TMS, TDI and TCK have pull-up resistors. TDO is an output, driven at up to VDDIO, and has no pull-up resistor.

### 7.2 RESET\_N pin

The RESET\_N pin is a schmitt input and integrates a permanent pull-up resistor to VDDIO. As the product integrates a power-on reset cell, the RESET\_N pin can be left unconnected in case no reset from the system needs to be applied to the product.

### 7.3 TWI pins

When these pins are used for TWI, the pins are open-drain outputs with slew-rate limitation and inputs with inputs with spike-filtering. When used as GPIO-pins or used for other peripherals, the pins have the same characteristics as PIO pins.

### 7.4 GPIO pins

All the I/O lines integrate a programmable pull-up resistor. Programming of this pull-up resistor is performed independently for each I/O line through the GPIO Controllers. After reset, I/O lines default as inputs with pull-up resistors disabled, except when indicated otherwise in the column "Reset State" of the GPIO Controller multiplexing tables.

## 8. Memories

### 8.1 Embedded Memories

- Internal High-Speed Flash
  - 512 KBytes (AT32UC3A0512, AT32UC3A1512)
  - 256 KBytes (AT32UC3A0256, AT32UC3A1256)
  - 128 KBytes (AT32UC3A1128)
    - 0 Wait State Access at up to 30 MHz in Worst Case Conditions
    - 1 Wait State Access at up to 60 MHz in Worst Case Conditions
    - Pipelined Flash Architecture, allowing burst reads from sequential Flash locations, hiding penalty of 1 wait state access
    - Pipelined Flash Architecture typically reduces the cycle penalty of 1 wait state operation to only 15% compared to 0 wait state operation
    - 10 000 Write Cycles, 10-year Data Retention Capability
    - 1 ms Page Programming Time, 2 ms Chip Erase Time
    - Sector Lock Capabilities, Bootloader Protection, Security Bit
    - 64 Fuses, 32 Of Which Are Preserved During Chip Erase
    - User Page For Data To Be Preserved During Chip Erase
- Internal High-Speed SRAM, Single-cycle access at full speed
  - 64 KBytes (AT32UC3A0512, AT32UC3A0, AT32UC3A0256 & AT32UC3A1256)
  - 32KBytes (AT32UC3A1128)

### 8.2 Physical Memory Map

The system bus is implemented as a bus matrix. All system bus addresses are fixed, and they are never remapped in any way, not even in boot. Note that AVR32 UC CPU uses unsegmented translation, as described in the AVR32 Architecture Manual. The 32-bit physical address space is mapped as follows:

**Table 8-1.** AT32UC3A Physical Memory Map

Start Address	Size					Device
	AT32UC3A0512	AT32UC3A1512	AT32UC3A0256	AT32UC3A1256	AT32UC3A1128	
0x0000_0000	64 Kbyte	64 Kbyte	64 Kbyte	64 Kbyte	32 Kbyte	Embedded SRAM
0x8000_0000	512 Kbyte	512 Kbyte	256 Kbyte	256 Kbyte	128 Kbyte	Embedded Flash
0xC000_0000	16 Mbyte	-	16 Mbyte	-	-	EBI SRAM CS0
0xC800_0000	16 Mbyte	-	16 Mbyte	-	-	EBI SRAM CS2

0xE000_0000	64 Kbyte	USB Configuration				
0xFFFF_0000	64 Kbyte	HSB-PB Bridge A				
0xFFFF_FFFF	64 Kbyte	HSB-PB Bridge B				

Accesses to unused areas returns an error result to the master requesting such an access.

The bus matrix has the several masters and slaves. Each master has its own bus and its own decoder, thus allowing a different memory mapping per master. The master number in the table

below can be used to index the HMATRIX control registers. For example, MCFG0 is associated with the CPU Data master interface.

**Table 8-2.** High Speed Bus masters

Master 0	CPU Data
Master 1	CPU Instruction
Master 2	CPU SAB
Master 3	PDCA
Master 4	MACB DMA
Master 5	USBB DMA

Each slave has its own arbiter, thus allowing a different arbitration per slave. The slave number in the table below can be used to index the HMATRIX control registers. For example, SCFG3 is associated with the Internal SRAM Slave Interface.

**Table 8-3.** High Speed Bus slaves

Slave 0	Internal Flash
Slave 1	HSB-PB Bridge 0
Slave 2	HSB-PB Bridge 1
Slave 3	Internal SRAM Slave
Slave 4	USBB Slave
Slave 5	EBI

## 9.2 Interrupt Request Signal Map

The various modules may output Interrupt request signals. These signals are routed to the Interrupt Controller (INTC), described in a later chapter. The Interrupt Controller supports up to 64 groups of interrupt requests. Each group can have up to 32 interrupt request signals. All interrupt signals in the same group share the same autovector address and priority level. Refer to the documentation for the individual submodules for a description of the semantic of the different interrupt requests.

The interrupt request signals are connected to the INTC as follows.

## 9.3 Clock Connections

### 9.3.1 Timer/Counters

Each Timer/Counter channel can independently select an internal or external clock source for its counter:

**Table 9-3.** Timer/Counter clock connections

Source	Name	Connection
Internal	TIMER_CLOCK1	clk_slow
	TIMER_CLOCK2	clk_pba / 4
	TIMER_CLOCK3	clk_pba / 8

### 9.3.2 USARTs

Each USART can be connected to an internally divided clock:

**Table 9-4.** USART clock connections

USART	Source	Name	Connection
0	Internal	CLK_DIV	clk_pba / 8
1			
2			
3			

### 9.3.3 SPIs

Each SPI can be connected to an internally divided clock:

**Table 9-5.** SPI clock connections

SPI	Source	Name	Connection
0	Internal	CLK_DIV	clk_pba / 32

## 9.4 Nexus OCD AUX port connections

If the OCD trace system is enabled, the trace system will take control over a number of pins, irrespectively of the PIO configuration. Two different OCD trace pin mappings are possible,

depending on the configuration of the OCD AXS register. For details, see the AVR32 UCTechnical Reference Manual.

## 9.8 Peripheral overview

### 9.8.1 External Bus Interface

- Optimized for Application Memory Space support
- Integrates Two External Memory Controllers:
  - Static Memory Controller
  - SDRAM Controller
- Optimized External Bus:
  - 16-bit Data Bus
  - 24-bit Address Bus, Up to 16-Mbytes Addressable
  - Optimized pin multiplexing to reduce latencies on External Memories
- 4 SRAM Chip Selects, 1SDRAM Chip Select:
  - Static Memory Controller on NCS0
  - SDRAM Controller or Static Memory Controller on NCS1
  - Static Memory Controller on NCS2
  - Static Memory Controller on NCS3

### **9.8.2 Static Memory Controller**

- 5 Chip Selects Available
- 64-Mbyte Address Space per Chip Select
- 8-, 16-bit Data Bus
- Word, Halfword, Byte Transfers
- Byte Write or Byte Select Lines
- Programmable Setup, Pulse And Hold Time for Read Signals per Chip Select
- Programmable Setup, Pulse And Hold Time for Write Signals per Chip Select
- Programmable Data Float Time per Chip Select
- Compliant with LCD Module
- External Wait Request
- Automatic Switch to Slow Clock Mode
- Asynchronous Read in Page Mode Supported: Page Size Ranges from 4 to 32 Bytes

### **9.8.3 SDRAM Controller**

- Numerous Configurations Supported
  - 2K, 4K, 8K Row Address Memory Parts
  - SDRAM with Two or Four Internal Banks
  - SDRAM with 16- or 32-bit Data Path
- Programming Facilities
  - Word, Half-word, Byte Access
  - Automatic Page Break When Memory Boundary Has Been Reached
  - Multibank Ping-pong Access
  - Timing Parameters Specified by Software
  - Automatic Refresh Operation, Refresh Rate is Programmable
- Energy-saving Capabilities
  - Self-refresh, Power-down and Deep Power Modes Supported
  - Supports Mobile SDRAM Devices
- Error Detection
  - Refresh Error Interrupt
- SDRAM Power-up Initialization by Software
- CAS Latency of 1, 2, 3 Supported
- Auto Precharge Command Not Used

### **9.8.4 USB Controller**

- USB 2.0 Compliant, Full-/Low-Speed (FS/LS) and On-The-Go (OTG), 12 Mbit/s
- 7 Pipes/Endpoints
- 960 bytes of Embedded Dual-Port RAM (DPRAM) for Pipes/Endpoints
- Up to 2 Memory Banks per Pipe/Endpoint (Not for Control Pipe/Endpoint)
- Flexible Pipe/Endpoint Configuration and Management with Dedicated DMA Channels
- On-Chip Transceivers Including Pull-Ups

### **9.8.5 Serial Peripheral Interface**

- Supports communication with serial external devices
  - Four chip selects with external decoder support allow communication with up to 15 peripherals
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD Controllers, CAN Controllers and Sensors
  - External co-processors

- Master or slave serial peripheral bus interface
  - 8- to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delays between consecutive transfers and between clock and data per chip select
  - Programmable delay between consecutive transfers
  - Selectable mode fault detection
- Very fast transfers supported
  - Transfers with baud rates up to MCK
  - The chip select line may be left active to speed up transfers on the same device

#### 9.8.6 Two-wire Interface

- High speed up to 400kbit/s
- Compatibility with standard two-wire serial memory
- One, two or three bytes for slave address
- Sequential read/write operations

#### 9.8.7 USART

- Programmable Baud Rate Generator
- 5- to 9-bit full-duplex synchronous or asynchronous serial communications
  - 1, 1.5 or 2 stop bits in Asynchronous Mode or 1 or 2 stop bits in Synchronous Mode
  - Parity generation and error detection
  - Framing error detection, overrun error detection
  - MSB- or LSB-first
  - Optional break generation and detection
  - By 8 or by-16 over-sampling receiver frequency
  - Hardware handshaking RTS-CTS
  - Receiver time-out and transmitter timeguard
  - Optional Multi-drop Mode with address generation and detection
  - Optional Manchester Encoding
- RS485 with driver control signal
- ISO7816, T = 0 or T = 1 Protocols for interfacing with smart cards
  - NACK handling, error counter with repetition and iteration limit
- IrDA modulation and demodulation
  - Communication at up to 115.2 Kbps
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo

#### 9.8.8 Serial Synchronous Controller

- Provides serial synchronous communication links used in audio and telecom applications (with CODECs in Master or Slave Modes, I2S, TDM Buses, Magnetic Card Reader, etc.)
- Contains an independent receiver and transmitter and a common clock divider
- Offers a configurable frame sync and data length
- Receiver and transmitter can be programmed to start automatically or on detection of different event on the frame sync signal
- Receiver and transmitter include a data signal, a clock signal and a frame synchronization signal

#### 9.8.9 Timer Counter

- Three 16-bit Timer Counter Channels
- Wide range of functions including:
  - Frequency Measurement

- Event Counting
- Interval Measurement
- Pulse Generation
- Delay Timing
- Pulse Width Modulation
- Up/down Capabilities
- Each channel is user-configurable and contains:
  - Three external clock inputs
  - Five internal clock inputs
  - Two multi-purpose input/output signals
- Two global registers that act on all three TC Channels

#### 9.8.10 Pulse Width Modulation Controller

- 7 channels, one 16-bit counter per channel
- Common clock generator, providing Thirteen Different Clocks
  - A Modulo n counter providing eleven clocks
  - Two independent Linear Dividers working on modulo n counter outputs
- Independent channel programming
  - Independent Enable Disable Commands
  - Independent Clock
  - Independent Period and Duty Cycle, with Double Bufferization
  - Programmable selection of the output waveform polarity
  - Programmable center or left aligned output waveform

#### 9.8.11 Ethernet 10/100 MAC

- Compatibility with IEEE Standard 802.3
- 10 and 100 Mbits per second data throughput capability
- Full- and half-duplex operations
- MII or RMII interface to the physical layer
- Register Interface to address, data, status and control registers
- DMA Interface, operating as a master on the Memory Controller
- Interrupt generation to signal receive and transmit completion
- 28-byte transmit and 28-byte receive FIFOs
- Automatic pad and CRC generation on transmitted frames
- Address checking logic to recognize four 48-bit addresses
- Support promiscuous mode where all valid frames are copied to memory
- Support physical layer management through MDIO interface control of alarm and update time/calendar data

## 10. Boot Sequence

This chapter summarizes the boot sequence of the AT32UC3A. The behaviour after power-up is controlled by the Power Manager. For specific details, refer to [Section 13. "Power Manager \(PM\)" on page 47.](#)

### 10.1 Starting of clocks

After power-up, the device will be held in a reset state by the Power-On Reset circuitry, until the power has stabilized throughout the device. Once the power has stabilized, the device will use the internal RC Oscillator as clock source.

On system start-up, the PLLs are disabled. All clocks to all modules are running. No clocks have a divided frequency, all parts of the system receives a clock with the same frequency as the internal RC Oscillator.

### 10.2 Fetching of initial instructions

After reset has been released, the AVR32 UC CPU starts fetching instructions from the reset address, which is 0x8000\_0000. This address points to the first address in the internal Flash.

The code read from the internal Flash is free to configure the system to use for example the PLLs, to divide the frequency of the clock routed to some of the peripherals, and to gate the clocks to unused peripherals.

\*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 11.2 DC Characteristics

The following characteristics are applicable to the operating temperature range:  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ , unless otherwise specified and are certified for a junction temperature up to  $T_J = 100^\circ\text{C}$ .

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{VDDCORE}$	DC Supply Core			1.65		1.95

## 11.3 Power Consumption

The values in [Table 11-1](#) and [Table 11-2 on page 35](#) are measured values of power consumption with operating conditions as follows:

- $V_{DDIO} = 3.3\text{V}$
- $V_{VDDCORE} = V_{VDDSYS} = 1.8\text{V}$
- $T_A = 25^\circ\text{C}$
- I/Os are inactive

These figures represent the power consumption measured on the power supplies.

**Table 11-1.** Power Consumption for Different Modes<sup>(1)</sup>

Mode	Conditions	Consumption	Unit
Active	Core/HSB clock is 66 MHz. PBA clock is 30 MHz. PBB clock is 66 MHz. All peripheral clocks activated. Measured while the processor is executing a recursive Fibonacci algorithm.	40	mA

## 12. Mechanical Characteristics

### 12.1 Thermal Considerations

#### 12.1.1 Thermal Data

Table 12-1 summarizes the thermal resistance data depending on the package.

**Table 12-1.** Thermal Resistance Data

Symbol	Parameter	Condition	Package	Typ	Unit
$\theta_{JA}$	Junction-to-ambient thermal resistance	Still Air	TQFP100	TBD	°C/W
$\theta_{JC}$	Junction-to-case thermal resistance		TQFP100	TBD	
$\theta_{JA}$	Junction-to-ambient thermal resistance	Still Air	LQFP144	TBD	°C/W
$\theta_{JC}$	Junction-to-case thermal resistance		LQFP144	TBD	

#### 12.1.2 Junction Temperature

The average chip-junction temperature,  $T_J$ , in °C can be obtained from the following:

1.  $T_J = T_A + (P_D \times \theta_{JA})$
2.  $T_J = T_A + (P_D \times (\theta_{HEATSINK} + \theta_{JC}))$

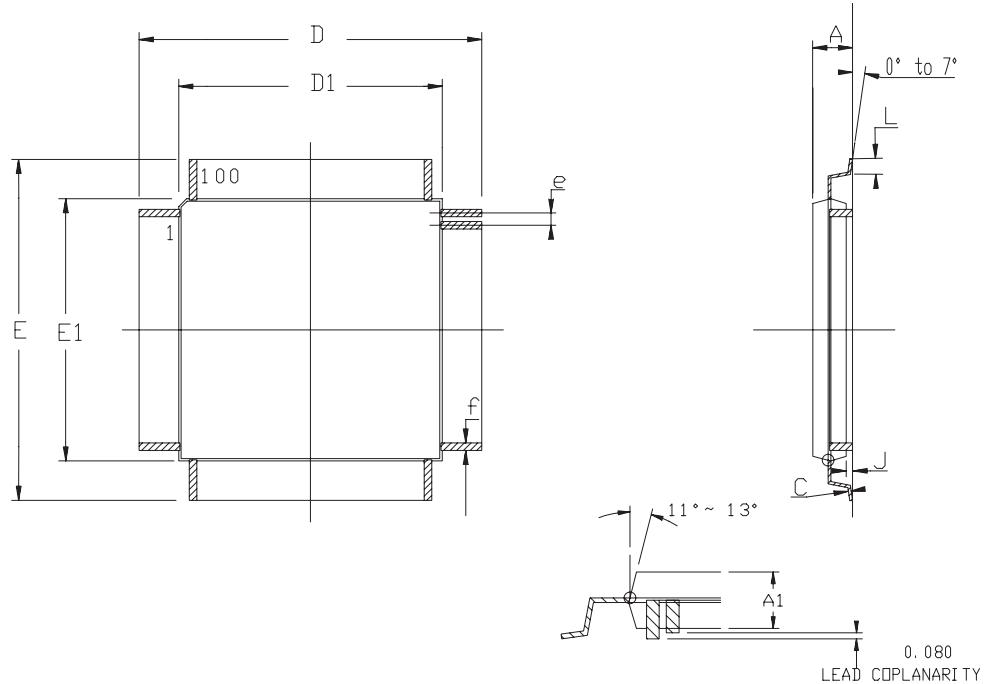

where:

- $\theta_{JA}$  = package thermal resistance, Junction-to-ambient (°C/W), provided in [Table 12-1 on page 41](#).
- $\theta_{JC}$  = package thermal resistance, Junction-to-case thermal resistance (°C/W), provided in [Table 12-1 on page 41](#).
- $\theta_{HEAT SINK}$  = cooling device thermal resistance (°C/W), provided in the device datasheet.
- $P_D$  = device power consumption (W) estimated from data provided in the section "[Power Consumption](#)" on page 34.
- $T_A$  = ambient temperature (°C).

From the first equation, the user can derive the estimated lifetime of the chip and decide if a cooling device is necessary or not. If a cooling device is to be fitted on the chip, the second equation should be used to compute the resulting average chip-junction temperature  $T_J$  in °C.

## 14. Errata

### 14.1 Rev. E

#### 1. SPI FDIV option does not work

Selecting clock signal using FDIV = 1 does not work as specified.

##### Fix/Workaround

Do not set FDIV = 1.

#### 2. PWM counter restarts at 0x0001

The PWM counter restarts at 0x0001 and not 0x0000 as specified. Because of this the first PWM period has one more clock cycle.

##### Fix/Workaround

- The first period is 0x0000, 0x0001, ..., period
- Consecutive periods are 0x0001, 0x0002, ..., period

#### 3. PWM channel interrupt enabling triggers an interrupt

When enabling a PWM channel that is configured with center aligned period (CALG=1), an interrupt is signalled.

##### Fix/Workaround

When using center aligned mode, enable the channel and read the status before channel interrupt is enabled.

#### 4. PWM update period to a 0 value does not work

It is impossible to update a period equal to 0 by the using the PWM update register (PWM\_CUPD).

##### Fix/Workaround

Do not update the PWM\_CUPD register with a value equal to 0.

#### 5. PWM channel status may be wrong if disabled before a period has elapsed

Before a PWM period has elapsed, the read channel status may be wrong. The CHIDx-bit for a PWM channel in the PWM Enable Register will read '1' for one full PWM period even if the channel was disabled before the period elapsed. It will then read '0' as expected.

##### Fix/Workaround

Reading the PWM channel status of a disabled channel is only correct after a PWM period has elapsed.

**6. SSC does not trigger RF when data is low**

The SSC cannot transmit or receive data when CKS = CKDIV and CKO = none, in TCMR or RCMR respectively.

**Fix/Workaround**

Set CKO to a value that is not "none" and bypass the output of the TK/RK pin with the PIO.

**7. SSC Data is not sent unless clock is set as output**

The SSC cannot transmit or receive data when CKS = CKDIV and CKO = none, in TCMR or RCMR respectively.

**Fix/Workaround**

Set CKO to a value that is not "none" and bypass the output of the TK/RK pin with the PIO.

**8. USB No end of host reset signaled upon disconnection**

In host mode, in case of an unexpected device disconnection whereas a usb reset is being sent by the usb controller, the UHCON.RESET bit may not been cleared by the hardware at the end of the reset.

**Fix/Workaround**

A software workaround consists in testing (by polling or interrupt) the disconnection (UHINT.DDISCI == 1) while waiting for the end of reset (UHCON.RESET == 0) to avoid being stuck.

**9. Incorrect Processor ID**

The processor ID reads 0x01 and not 0x02 as it should.

**Fix/Workaround**

None.

**10. Bus error should be masked in Debug mode**

If a bus error occurs during debug mode, the processor will not respond to debug commands through the DINST register.

**Fix/Workaround**

A reset of the device will make the CPU respond to debug commands again.

**11. Code execution from external SDRAM does not work**

Code execution from SDRAM does not work.

**Fix/Workaround**

Do not run code from SDRAM.

**12. Read Modify Write (RMW) instructions on data outside the internal RAM does not work.**

Read Modify Write (RMW) instructions on data outside the internal RAM does not work.

**Fix/Workaround**

Do not perform RMW instructions on data outside the internal RAM.

---

### **13. USART Manchester Encoder Not Working**

Manchester encoding/decoding is not working.

#### **Fix/Workaround**

Do not use manchester encoding.

### **14. USART RXBREAK problem when no timeguard**

In asynchronous mode the RXBREAK flag is not correctly handled when the timeguard is 0 and the break character is located just after the stop bit.

#### **Fix/Workaround**

If the NBSTOP is 1, timeguard should be different from 0.

### **15 USART Handshaking: 2 characters sent / CTS rises when TX**

If CTS switches from 0 to 1 during the TX of a character, if the Holding register is not empty, the TXHOLDING is also transmitted.

#### **Fix/Workaround**

None.

### **16. USART PDC and TIMEGUARD not supported in MANCHESTER**

Manchester encoding/decoding is not working.

#### **Fix/Workaround**

Do not use manchester encoding.

### **17. Voltage regulator input and output is connected to VDDIO and VDDCORE inside the device**

The voltage regulator input and output is connected to VDDIO and VDDCORE respectively inside the device.

#### **Fix/Workaround**

Do not supply VDDCORE externally, as this supply will work in parallel with the regulator.

### **18. ADC possible miss on DRDY when disabling a channel**

The ADC does not work properly when more than one channel is enabled.

#### **Fix/Workaround**

Do not use the ADC with more than one channel enabled at a time.

### **19. ADC OVRE flag sometimes not reset on Status Register read**

The OVRE flag does not clear properly if read simultaneously to an end of conversion.

#### **Fix/Workaround**

None.

### **20. CRC calculation of a locked device will calculate CRC for 512 kB of flash memory, even though the part has less flash.**

#### **Fix/Workaround**

The flash address space is wrapping, so it is possible to use the CRC value by calculating CRC of the flash content concatenated with itself N times. Where N is 512 kB/flash size.

### **21. SDRAM SDCKE rise at the same time as SDCK while exiting self-refresh mode**

SDCKE rise at the same time as SDCK while exiting self-refresh mode.

**Fix/Workaround**

None.

**22. PCx pins go low in stop mode**

In sleep mode stop all PCx pins will be controlled by GPIO module instead of oscillators. This can cause drive contention on the XINx in worst case.

**Fix/Workaround**

Before entering stop mode set all PCx pins to input and GPIO controlled.

**23. Need two NOPs instruction after instructions masking interrupts**

The instructions following in the pipeline the instruction masking the interrupt through SR may behave abnormally.

**Fix/Workaround**

Place two NOPs instructions after each SSRF or MTSR instruction setting IxM or GM in SR.
