

# AP1705/6/7

## Processor Supervisory Circuits

### ■ Features

- Power-on reset generator with fixed delay time of 200ms (AP1705/6/7)
- Manual reset input (AP1705/7)
- Reset output available in active-Low (AP1705/6/7), active-high (AP1706/7)
- Supply voltage supervision range 2.5V, 3V, 3.3V, 5V
- Watchdog timer (AP1705/6/7)
- Supply current of 25µA (Typ.)
- SOT23-5, SOT23-6, TSOT23-5 and TSOT23-6 **Pb-Free** Package
- Temperature range: -40°C to 85°C

### ■ Applications

- Applications Using DSPs, Microcontrollers, or Microprocessors
- Industrial Equipment
- Programmable Controls
- Automotive Systems
- Portable/Battery-Powered Equipment
- Intelligent Instruments
- Wireless Communications Systems
- Notebook/Desktop Computers

### ■ General Description

The AP1705/6/7 family of supervisors provides circuit initialization and timing supervision, primarily for DSP and processor-based systems.

During power-on,  $\overline{\text{RESET}}$  is asserted when supply voltage  $V_{CC}$  becomes higher than 1.1V. Thereafter, the supply voltage supervisor monitors  $V_{CC}$  and keeps  $\overline{\text{RESET}}$  active as long as  $V_{CC}$  remains below the threshold voltage  $V_{IT-}$ . An internal timer delays the return of the output to the inactive state (high) to ensure proper system reset. The delay time  $t_d$ , starts after  $V_{CC}$  has risen above the threshold voltage  $V_{IT-}$ . When the supply voltage drops below the threshold voltage  $V_{IT-}$ , the output becomes active (low) again. No external components are required. All the devices of this family have a fixed-sense threshold voltage  $V_{IT-}$ , set by an internal voltage divider.

The AP1705/7 devices incorporate a manual reset input,  $\overline{\text{MR}}$ . A low level at  $\overline{\text{MR}}$  causes  $\overline{\text{RESET}}$  to become active. The AP1706/7 devices include a high-level output  $\overline{\text{RESET}}$ . AP1705/6/7 have a watchdog timer that is periodically triggered by a positive or negative transition at  $\overline{\text{WDI}}$ . When the supervising system fails to retrigger the watchdog circuit within the time-out interval,  $t_{\text{tout}}$ ,  $\overline{\text{RESET}}$  becomes active for the time period  $t_d$ . This event also reinitializes the watchdog timer. Leaving  $\overline{\text{WDI}}$  unconnected disables the watchdog. In applications where the input to the  $\overline{\text{WDI}}$  pin may be active (transitioning high and low) when the AP1705/6/7 asserting  $\overline{\text{RESET}}$ , the AP1705/6/7 does not return to a non-reset state when the input voltage is above  $V_t$ . If the application requires that input to  $\overline{\text{WDI}}$  is active when  $\overline{\text{RESET}}$  is asserted,  $\overline{\text{WDI}}$  must be decoupled from the active signal. This can be accomplished by using an N-channel FET in series with the  $\overline{\text{WDI}}$  pin, with the gate of the FET connected to the  $\overline{\text{RESET}}$  output as shown in Figure 1.

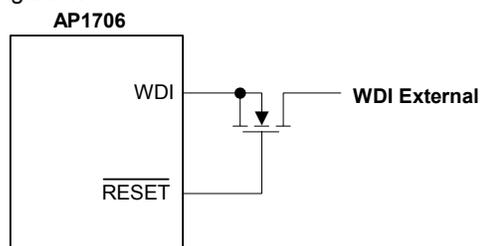

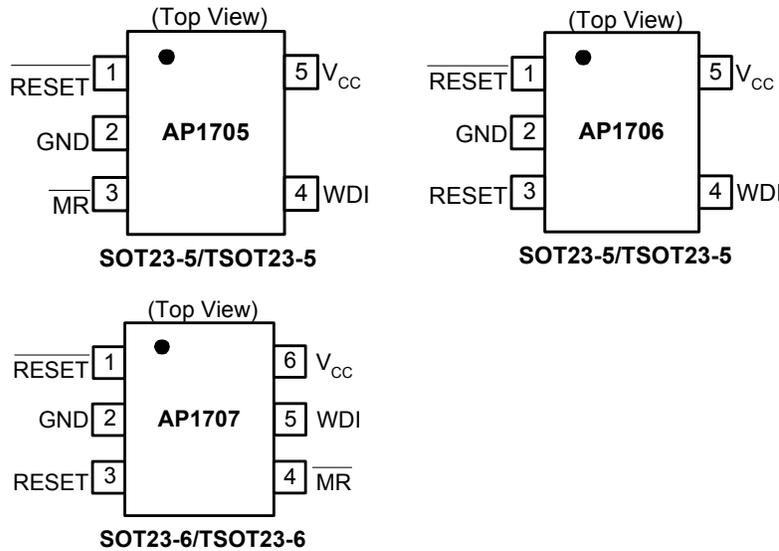

Figure 1.

The product spectrum is designed for supply voltage of 2.5V, 3V, 3.3V and 5V. The circuits are available in a SOT23-5L, SOT23-6L, and TSOT23-5L, TSOT23-6L packages. The AP1705/6/7 devices are characterized for operation over a temperature range of -40°C to 85°C.

\* Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

**Note 1:** All voltage values are with respect to GND.
