## Appendix B: Application Note 2

### B.1 Advance Application for Using Crystal

Date: May 21, 1999

Condition: In short cable, AX88195 +AH 101 Phyceiver can't link to BCM 5308 Switch.

Conclusion: 1. After measuring and verifying, we found it's relevant to clock source.  
2. We ascertain the problem is caused by matching issues between crystal and capacitor.

Solution: Change the value of capacitors beside crystal as below:

Note: The capacitors may be various depend on the specification of crystal. While designing, please refer to the circuit provided by crystal supplier.

## Appendix C: Application Note for RDY is not applicable

This application note is for some kind of CPU that doesn't support asynchronous wait state insertion function. For example, 8051 CPU series have only fix access cycle time. For some application that the CPU has the capability of wait state insertion, but the designer do not want to use the handshake signal in order to simply the design. This application note is helpful for those cases.

The following criteria must be meet:

1. The bus access timing must meet the AC timing specification.
2. The "remote DMA" move data from/to data port access time can't faster than 120ns.

Solution:

Because of the access time from FIFO to Packet Buffer RAM or from Packet Buffer RAM to FIFO is 120ns/Word. The "remote DMA read" operation is the only case that RDY signal will be active to request some wait state to pre-fetch data from RAM into FIFO. As soon as the first word of data feed into the FIFO, the RDY will not active again for the lasting cycle. For the critical time, just insert "No Operation" instruction (to insert wait state using software) after write remote DMA read command and before read data port.

**Ex : IOBASE=300 ; Insert wait state by software.**

```
Mov dx,308h      ; Index = 308h
Mov al,0h        ;
Out dx,al        ; Set Remote Start Address low byte = 0
Inc dx           ; Index = 309h
Mov al,4dh       ;
Out dx,al        ; Set Remote Start Address high byte = 4d
Inc dx           ; Index = 30Ah
Mov al,40h       ;
Out dx,al        ; Set Remote DMA Byte Count low byte = 40h
Inc dx           ; Index = 30Bh
Mov al,40h       ;
Out dx,al        ; Set Remote DMA Byte Count high byte = 00h
Mov dx,300h      ; Index = 300h
Mov al,0ah       ;
Out dx,al        ; Set remote DMA read command
Nop             ; Insert wait state here
Nop             ; Insert more wait states again if necessary
Mov dx,310h      ; Index = 310h
Lea di, RxBuffer ; Set Rx Buffer Address
Mov cx, RxLen    ; Set Rx Length
Rep insw         ; Read data port
...
```

## Errata of AX88195 V1

### 1. Interrupt Status can't always clean up

Solution : Using software to do clean and check iteration until clean up.

Ex : IOBASE=300 ; Clear Tx/Rx interrupt.

```

                                Mov dx,307h
ClrISR :
                                Mov al,3      ; clear Tx/Rx interrupt
                                Out dx,al     ; output to clear ISR
                                In  al,dx     ; read ISR
                                Test al,3    ; Check ISR cleared or not
                                Jz  ClrISRDone ; Clear ok
                                Mov al,0     ; if not, clear again
                                Out dx,al
                                Jmp ClrISR
ClrISRDone: ...                  ; clear successful
```

### 2. DTACK can't fit 68K CPU timing in 68K mode

Solution : Using the DTACK automatic insertion function in 68K CPU.
