

# AS8220A

## FlexRay™ Basis Transceiver

Objective  
Data Sheet

### 1 General Description

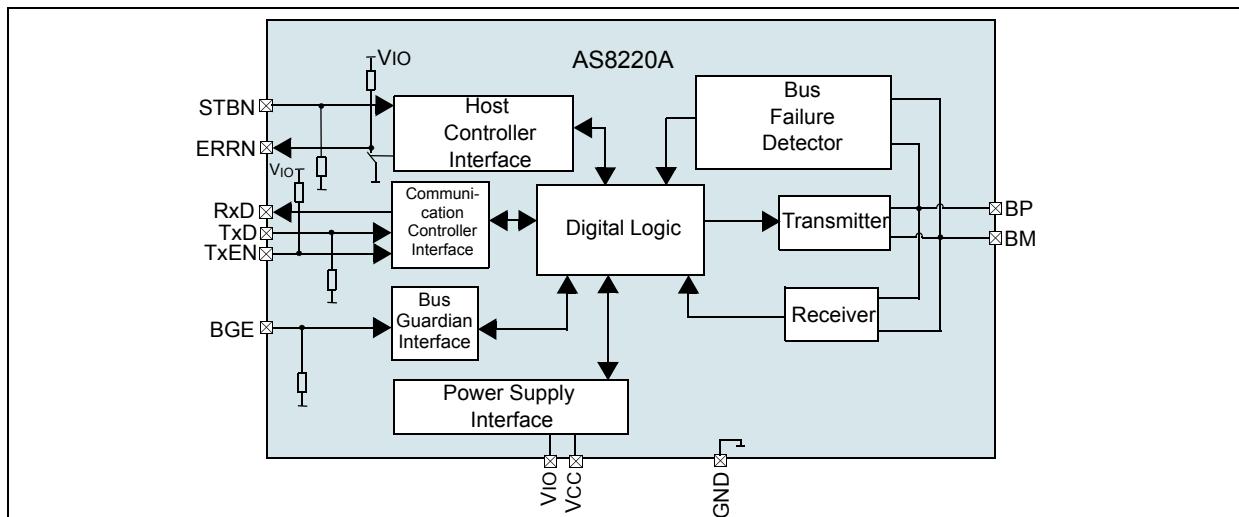

This objective data sheet describes the intended functionality of the AS8220A bus transceiver. As long the device is not fully qualified, the parameters are not characterized in the means that parameters may change or can be updated during final product qualification and characterization. This document shows the objective of the AS8220A and this document is subjected to change without notice.

The AS8220A is a high-speed automotive transceiver for fault tolerant and high speed applications, operating as the bi-directional interface between a generic communication controller and the twisted pair copper wires. The device enables two-way communication with the microcontroller with full mode handling, including the low-power modes.

The transmission rates up to 10Mbps as well as the implemented Bus Guardian interface enables this transceiver the usage in fault tolerant and hard real-time applications in the stringent automotive environment. An extended diagnostic interface, offers advanced bus-failure detection capabilities with the intelligent combination of bus-current measurement and logical comparators.

A thermal sensor circuit with an integral shutdown mechanism prevents damage to the device in extreme temperature conditions. The symmetrical transient control for the high- and low-side driver for both the bus-minus and bus-plus line allows an ideal balance of communications over different network topologies, with excellent EMC performance. The product is available in SSOP14 package.

*Figure 1. Block Diagram*

### 2 Key Features

- Data transfer up to 10 Mbps
- Compliant with FlexRay Electrical Physical Layer Specification V2.1 Rev. B
- Excellent EMC performances. High common mode range insure excellent EMI
- Enable pin for an optional bus guardian
- Automatic thermal shutdown protection
- Low standby current
- Supports 2.5, 3, 3.3, 5 V micro controllers and automatically adapts to interface levels
- Protection against damage due to short circuit conditions on the bus (positive and negative battery voltage)
- Operating temperature range -40°C to +125°C

### 3 Applications

The device is ideal for high speed automotive bus systems, backbone bus and gateways, X-by-wire systems, redundant bus systems, bus topologies with Active Stars, and safety critical applications. Designed for FlexRay, where the basic features are demanded.

## 4 Pin Assignments

Figure 2. Pin Assignments SSOP14 Package

## Pin Descriptions

Table 1. Pin Descriptions

Pin Name	Pin Number	Description
VIO	1	I/O supply voltage
TxD	2	Transmit data input
TxEN	3	Transmitter enable input
RxD	4	Receive data output
BGE	5	Bus guardian enable input
STBN	6	Standby input
ERRN	10	Error diagnosis output
GND	11	Ground
BM	12	Bus line Minus
BP	13	Bus line Plus
Vcc	14	Supply Voltage

## 5 Absolute Maximum Ratings

Stresses beyond those listed in [Table 2](#) may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in [Section 6 Electrical Characteristics on page 6](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

*Table 2. Absolute Maximum Ratings*

Parameter	Min	Max	Units	Notes
Supply Voltage (Vcc)	-0.3	+7.0	V	
Supply Voltage (Vio)	-0.3	+7.0	V	
DC Voltage at EN, STBN, ERRN, TxD, RxD, TxEN, BGE, RxEN	-0.3	Vio + 0.3	V	Vio < Vcc
DC Voltage at BP and BM	-40	+50	V	
Input current (latchup immunity)	-100	100	mA	According to JEDEC 78
Electrostatic discharge at bus lines BP and BM	-4	+4	kV	According to AEC-Q100-002
Electrostatic discharge	-2	+2	kV	According to AEC-Q100-002
Transient voltage on BP, BM	-200	+200	V	According to ISO7637 part3 test pulses a and b; class C; RL=45 W, CL= 100 pF; (see <a href="#">Figure 17 on page 24</a> ).
Total power dissipation (all supplies and outputs)		150	mW	
Storage temperature	-55	+150	°C	
Junction temperature	-40	+150	°C	
Package body temperature <sup>1</sup>		250	°C	
Humidity non-condensing	5	85	%	

1. The reflow peak soldering temperature (body temperature) specified is in accordance with *IPC/JEDEC J-STD-020C "Moisture/Reflow Sensitivity Classification for Non-Hermetic Solid State Surface Mount Devices"*. The lead finish for Pb-free leaded packages is matte tin (100% Sn).

## 6 Electrical Characteristics

$T_{VJ} = -40$  to  $+150$  °C,  $V_{CC} = +4.75V$  to  $+5.25V$ ,  $V_{IO} = +2.2$  to  $V_{CC}$ ,  $R_L = 45\Omega$ ,  $C_L = 100$  pF unless otherwise specified.

Table 3. Electrical Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Units
<b>Supply Voltage</b>						
$T_{AMB}$	Ambient temperature		-40		+125	°C
$V_{CC}-V_{IO}$	Difference of supplies		-0.1		3.05	V
$I_{CC}$	Vcc current consumption	STANDBY Mode <sup>1</sup> $V_{CC} = 0V$ to $+5.25V$	-5		30	µA
		NORMAL mode, driver enabled	0		45	mA
		NORMAL Mode, driver enabled, $R_{BUS} = \infty\Omega$	0		15	mA
		NORMAL mode, driver disabled	0		10	mA
$I_{IO}$	Vio current consumption	STANDBY mode <sup>1</sup> $V_{IO} = 0V$ to $+5.25V$	-5		5	µA
		NORMAL Mode	0		1	mA
<b>State Transitions</b>						
$t_{STBN\_RxD}$	Delay STBN high to RxD high with wake flag set		1		50	µs
$t_{STANDBY}$	go-to STANDBY hold time	INH1 low = 20% $V_{BAT}$	10		70	µs
<b>Transmitter</b>						
$V_{BUS\_DIFF\_D0}$	Differential bus voltage low in NORMAL mode (Data0)	$V_{BPdata0} - V_{BMdata0};$ $40\Omega < R_L < 55\Omega$	-2		-0.6	V
$V_{BUS\_DIFF\_D1}$	Differential bus voltage high in NORMAL mode (Data1)	$V_{BPdata1} - V_{BMdata1};$ $40\Omega < R_L < 55\Omega$	0.6		2	V
$\Delta V_{BUS\_DIFF}$	Matching between Data0 and Data1 differential bus voltage in NORMAL mode	$V_{BUS\_DIFF\_D0} - V_{BUS\_DIFF\_D1}$ $40\Omega < R_L < 55\Omega$	-200		200	mV
$V_{BUS\_COM\_D0}$	Common mode bus voltage in case of Data0 in NORMAL mode	$V_{BPdata0}/2 + V_{BMdata0}/2$ $40\Omega < R_L < 55\Omega$	0.4 * $V_{CC}$		0.6 * $V_{CC}$	V
$V_{BUS\_COM\_D1}$	Common mode bus voltage in case of Data1 in NORMAL mode	$V_{BPdata1}/2 + V_{BMdata1}/2$ $40\Omega < R_L < 55\Omega$	0.4 * $V_{CC}$		0.6 * $V_{CC}$	V
$\Delta V_{BUS\_COM}$	Matching between Data0 and Data1 common mode voltage	$V_{BUS\_COM\_D0} - V_{BUS\_COM\_D1}$ $40\Omega < R_L < 55\Omega$	-200		200	mV
$V_{BUS\_DIFF\_Idle}$	Absolute differential bus voltage in idle mode				30	mV
$IB_{BMShortMax}$ $IB_{BPShortMax}$	Absolute max current when BP is shorted to BM	$V_{BP}=V_{BM}$			+100	mA
$IB_{GNDShortMax}$	Absolute max current when BP is shorted to GND	$V_{BP}=0V$			+100	mA
$IB_{MNDShortMax}$	Absolute max current when BM is shorted to GND	$V_{BM}=0V$			+100	mA

## 8 Detailed Description

The AS8220A is a high-speed fault tolerant device operating as an interface between a generic controller and the copper wire physical bus. The AS8220A is designed to extend the application range for high speed and safety critical time triggered bus systems in an automotive environment. The drivers are short circuit protected against the positive and negative supply voltage to increase the robustness and reliability of automotive systems. The AS8220A operates at baudrates up to 10 Mbps to increase the bandwidth for automotive applications.

### Block Description

The electrical AS8220A high-speed bus-system transceiver is the interface between a FlexRay™ network node module and the channel. The transceiver provides differential transmit and receive capability to the bus, allowing the node module bidirectional time multiplexed binary data stream transfer. Besides the transmit and receive function, the transceiver provides low power management, supply voltage monitoring (under voltage detection) as well as bus failure detection and represents a ESD-protection barrier between the bus and the ECU.

The AS8220A consists of 8 different functional blocks ([see Figure 1](#)):

*Table 4. Functional Blocks*

Functional Block	Short Description
Host Controller Interface (HCI)	Digital interface between the transceiver and the host controller (HC) The host interface comprises the read out handler, which delivers failure and status information via the ERRN pin to the host controller.
Communication Controller Interface (CCI)	Digital interface between the transceiver and the FlexRay communication controller (CC)
Bus Guarding Interface (BGI)	Digital interface between the transceiver and the FlexRay bus guardian (BG)
Power Supply Interface (PSI)	The power supply interface consists of an sub functional block, the voltage monitor (VM) and includes two analogue inhibit outputs for signalling the internal state of the transceiver
Internal Logic (IL)	The digital signals from the functional blocks of the device are fed into the internal logic where the forwarding of FlexRay messages from analogue side to digital interfaces and vice versa is done. The state machine is performed in this block and is dealing the error, wake and power-on flags.
Bus Failure Detector (BFD) Temperature Protection (TP)	The bus failure detector is directly connected to the bus pins, in order to detect several external failure conditions which may occur on the bus. The temperature protection turns off the output driver when reaching the specified internal temperature in order to protect the device.
Transmitter	The transmitter provides the bus signals as specified on the bus lines.
Receiver	The receiver captures FlexRay valid signals on the bus lines and provides received data streams to the internal logic

### Events

Transitions in order to change between the operation modes are possible only when events are detected. The device supports two type of events, events on the host controller interface (STBN) and detection of undervoltage or supply voltage recovery. Whenever an event is recognized, a transition can be performed.

### Operating Modes

The AS8220A provides the following operating modes:

- NORMAL: non low power mode
- STANDBY: low power mode

## NORMAL mode

In this mode the transceiver is able to send and receive data signals on the bus. TxEN and BGE control the state of the transmitter. RxD reflects the bus data and reflect the bus state. In this mode, the transmitter state can be selected as shown in the [Table 5](#). In case the over-temperature flag is set the transmitter is disabled. The bus wires are terminated to Vcc/2 via receiver input resistances.

*Table 5. Transmitter State*

BGE	TxEN	TxD	Transmitter state	Bus State
H	L	H	Enabled	Data1 (BP is driven high, BM is driven low)
H	L	L	Enabled	Data0 (BP is driven low, BM is driven High)
X	H	X	Disabled	Idle (BP and BM are not driven)
L	X	X	Disabled	Idle (BP and BM are not driven)

- If the differential bus voltage is higher than  $V_{BUSActivehigh}$  or lower than  $V_{BUSActivelow}$  for a time longer than  $t_{BUSActivityDetection}$ , then activity is detected on the bus (Bus = active), RxD is released.
- If, after the activity detection, the differential bus voltage is higher than  $V_{Data1}$ , RxD is high.
- If, after the activity detection, the differential bus voltage is lower than  $V_{Data0}$ , RxD is low.
- If the absolute differential bus voltage is lower than  $V_{BUSActivehigh}$  and higher than  $V_{BUSActivelow}$  for a time longer than  $t_{BUSIdleDetection}$ , then idle is detected on the bus (Bus=idle), RxD is switched to logical "high"

## STANDBY mode

In this mode the transceiver is not able to send and receive data signals from the bus. The power consumption is significantly reduced respect the NORMAL mode. The bus wires are terminated to GND (bus state: Idle\_LP).

## Non Operating Mode

The AS8220A provides the following non operating mode:

### Power Off

In this mode the transceiver is not able to operate. RxD is set to high and ERRN is set to low. The bus wires are not connected to GND (bus state: Idle\_HZ).

## Undervoltage Events

### Undervoltage V<sub>IO</sub>

When V<sub>IO</sub> voltage falls below  $V_{IOTHL}$  for a time longer than  $t_{UV\_DETECT}$  then the undervoltage V<sub>IO</sub> flag is set and it is reset when V<sub>IO</sub> exceeds the voltage threshold  $V_{IOTHH}$  for a time longer than  $t_{UV\_REC}$ . The flag can be set or reset in all the operation modes. The flag is reset at power off.

### Undervoltage V<sub>CC</sub>

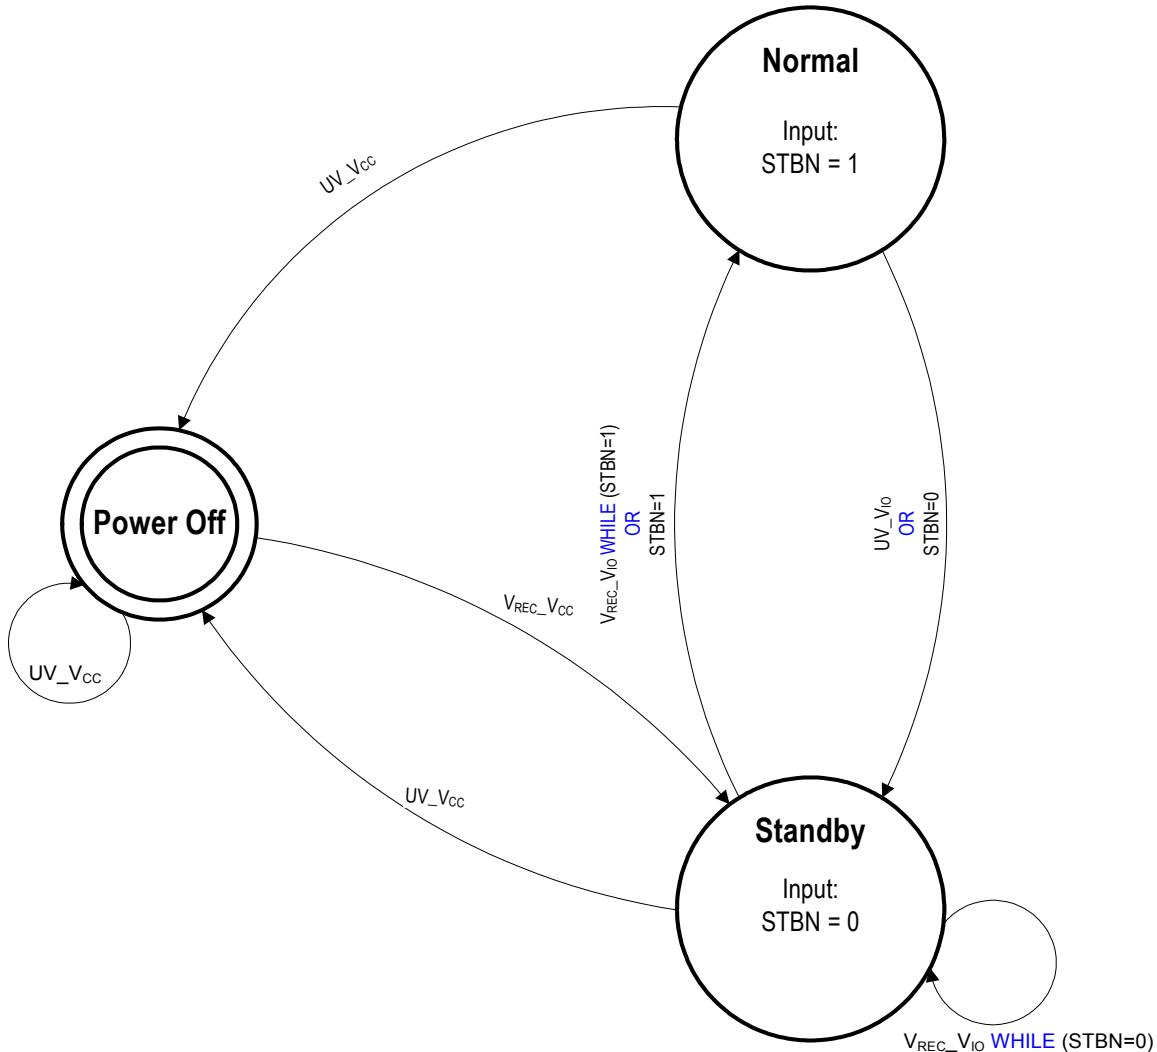

When V<sub>CC</sub> voltage falls below  $V_{CCTHL}$  for a time longer than  $t_{UV\_DETECT}$  then the undervoltage V<sub>CC</sub> flag is set and it is reset when V<sub>CC</sub> exceeds the voltage threshold  $V_{CCTHH}$  for a time longer than  $t_{UV\_REC}$ . The flag can be set or reset in all the operation modes. The flag is reset at power off.

## Power On/Off Events

- Starting from power off mode a power on event occurs in case undervoltage flag is reset.
- Starting from every operation mode a power off event occurs in case Vcc undervoltage flag is set.

## System Description

Figure 9. State Diagram

**Note:** In Table 7 the corresponding transition table is shown

Prefix of “**WHILE**” is always the event and suffix in brackets checks the flags or in case of STBN the input condition.  
For example:  $V_{REC\_VBAT}$  **WHILE** (STBN=1)

After the event  $V_{IO}$  supply voltage recovery is detected, the transition is performed if STBN is “high”.

Legend:

UV\_VIO: Undervoltage event and/or flag for  $V_{IO}$  supply voltage

UV\_VCC: Undervoltage event and/or flag for  $V_{CC}$  supply voltage

$V_{REC\_VIO}$ : Voltage recovery event and/or flag for  $V_{IO}$  supply voltage

$V_{REC\_VCC}$ : Voltage recovery event and/or flag for  $V_{CC}$  supply voltage

## Fail Silent Behavior

In order to be fail silent, undervoltage detection on the two power supplies V<sub>IO</sub> and V<sub>CC</sub> is implemented

- V<sub>IO</sub>: Supply voltage for I/O digital level adaptation
- V<sub>CC</sub>: Supply voltage (+5V)

### State transitions due to under voltage detection

- In case of V<sub>IO</sub> undervoltage is detected, STANDBY mode will be entered regardless of the voltage present on pin STBN.
- In case V<sub>CC</sub> undervoltage is present, the device will enter power off mode (bus state: Idle\_HZ), regardless on supply voltage at V<sub>IO</sub> and the voltage present on STBN.

### State transitions due to voltage recovery detection

- Starting from the power off, the device enters STANDBY mode only in case V<sub>CC</sub> undervoltage flag is reset..
- When V<sub>CC</sub> ≤ V<sub>CCTHL</sub> the device is in power off state and the bus wires are not terminated (bus state: Idle\_HZ).

## Mode Transitions

In case all the undervoltage flags are reset the operation mode is selected by STBN according to [Table 6](#).

*Table 6. Pin Signalling and Operating modes*

Inputs	Operation Mode	OutPut	
		RxD	RxE
H	NORMAL	L Bus = Data_0	L Bus = Active
		H Bus = Idle or Data_1	H Bus = Idle
L	STANDBY	H	H

**Where:** H = Digital level high

L = Digital level low

x = Do not care

Float = The analog output is not driven

*Table 7. Transition Table*

Supply Voltage Flag Event			Host Event	
Initial Mode	V <sub>IO</sub>	V <sub>CC</sub>	STBN	Next Mode
Normal	L	L	H→L	Standby
	L→H	L	X	
Standby	H→L	L	H	Normal
	L	L	L→H	
Power Off	X	H→L	X	Standby
Any	X	L→H	X	Power Off

## ERRN Signalling

The ERRN signalling is shown in [Table 8](#).

*Table 8. ERRN signalling*

SUPPLY VOLTAGE FLAG EVENT V <sub>IO</sub>		
	STBN	ERRN
L	H	not failure
L	L	H
L	X	L

**Note:** ERROR means the logic OR of the error flags

## Loss of ground

In case the ground of the device is disconnected and the host pins are open, the bus lines are switched to Idle\_HZ.

## Error Flags Description

### Bus error

The bus error flag is set when 2 consecutive rising edges on the TxD pin without any rising edge on the RxD pin are detected or when 2 consecutive falling edges on the TxD pin without any falling edge on the RxD pin are detected. This flag is reset when a rising edge on the TxD pin is followed by a rising edge on RxD pin before of the next TxD rising edge or when a falling edge on the TxD pin is followed by a falling edge on RxD pin before of the next TxD falling edge. This flag can be set or reset only in NORMAL mode when the transmitter is enabled. The flag is reset at power off.

### Low current on BP high side driver

This flag can only be set/reset in NORMAL mode when the driver is enabled and during the transmission of a stable Data1 longer than t<sub>BUS\_ERROR</sub>. If the absolute value of the BP pin current is lower than I<sub>THL</sub> after t<sub>BUS\_ERROR</sub> since the driver enable signal then the flag is set otherwise it is reset. The flag is reset at power off.

### Low current on BP low side driver

This flag can only be set/reset in NORMAL mode when the driver is enabled and during the transmission of a stable Data0 longer than t<sub>BUS\_ERROR</sub>. If the absolute value of the BP pin current is lower than I<sub>THL</sub> after t<sub>BUS\_ERROR</sub> since the driver enable signal then the flag is set otherwise it is reset. The flag is reset at power off.

### Low current on BM high side driver

This flag can only be set/reset in NORMAL mode when the driver is enabled and during the transmission of a stable Data0 longer than t<sub>BUS\_ERROR</sub>. If the absolute value of the BM pin current is lower than I<sub>THL</sub> after t<sub>BUS\_ERROR</sub> since the driver enable signal then the flag is set otherwise it is reset. The flag is reset at power off.

### Low current on BM low side driver

This flag can only be set/reset in NORMAL mode when the driver is enabled and during the transmission of a stable Data1 longer than t<sub>BUS\_ERROR</sub>. If the absolute value of the BM pin current is lower than I<sub>THL</sub> after t<sub>BUS\_ERROR</sub> since the driver enable signal then the flag is set otherwise it is reset. The flag is reset at power off.

### High current on BP high side driver

This flag can only be set/reset in NORMAL mode when the driver is enabled and during the transmission of a stable Data1 longer than t<sub>BUS\_ERROR</sub>. If the absolute value of the BP pin current is higher than I<sub>THH</sub> after t<sub>BUS\_ERROR</sub> since the driver enable signal then the flag is set otherwise it is reset. The flag is reset at power off.

### High current on BP low side driver

This flag can only be set/reset in NORMAL mode when the driver is enabled and during the transmission of a stable Data0 longer than t<sub>BUS\_ERROR</sub>. If the absolute value of the BP pin current is higher than I<sub>THH</sub> after t<sub>BUS\_ERROR</sub> since the driver enable signal then the flag is set otherwise it is reset. The flag is reset at power off.

### **High current on BM high side driver**

This flag can only be set/reset in NORMAL mode when the driver is enabled and during the transmission of a stable Data0 longer than  $t_{BUS\_ERROR}$ . If the absolute value of the BM pin current is higher than  $I_{THH}$  after  $t_{BUS\_ERROR}$  since the driver enable signal then the flag is set otherwise it is reset. The flag is reset at power off.

### **High current on BM low side driver**

This flag can only be set/reset in NORMAL mode when the driver is enabled and during the transmission of a stable Data1 longer than  $t_{BUS\_ERROR}$ . If the absolute value of the BM pin current is higher than  $I_{THH}$  after  $t_{BUS\_ERROR}$  since the driver enable signal then the flag is set otherwise it is reset. The flag is reset at power off.

### **BP open line**

This flag is the logical “AND” between: low current on BP high side and low current on BP low side.

### **BM open line**

This flag is the logical “AND” between: low current on BM high side and low current on BM low side.

### **BP short circuit to Vcc**

This flag is the logical “AND” between: low current on BP high side and high current on BP low side.

### **BP short circuit to GND**

This flag is the logical “AND” between: high current on BP high side and low current on BP low side.

### **BM short circuit to Vcc**

This flag is the logical “AND” between: low current on BM high side and high current on BM low side.

### **BM short circuit to GND**

This flag is the logical “AND” between: high current on BM high side and low current on BM low side.

### **Short circuit between BP and BM**

This flag can only be set or reset in NORMAL mode when the driver is enabled. After a time  $t_{BUS\_ERROR}$  since TxD edge if the absolute value of the differential bus voltage is lower than  $V_{SHORT}$  then the flag is set otherwise it is reset. The flag is reset at power off.

### **Over temperature**

This flag can only be set or reset in the non low power modes. The flag is set when the junction temperature exceeds  $OT_{TH}$  and it is reset when the junction temperature falls below  $OT_{TL}$ .

### **TxEN\_BGE timeout**

This flag can only be set in NORMAL mode when the driver is enabled (TxEN is low and BGE is high) for a time longer than  $t_{TxEN\_max}$ . It is reset every transition on TxEN or BGE or if the device exits NORMAL mode. If the flag is set the driver is disabled.

### **Error flag**

This flag is set if at least one error flag or if Vio flag is set and it is reset if none of the previous flag is set.

## **Status Flags Description**

### **Power on flag**

The power on flag is set leaving the power off state and it is reset entering a low power mode after a non low power mode.

## Transmitter

The transmitter generates out of a digital input signal on TxD the FlexRay differential bus voltage. The transmitter is only active in NORMAL mode when BGE is on logical high and TxEN is on logical low.

Figure 10. Transmitter characteristics ( $TxD \rightarrow BUS$ )

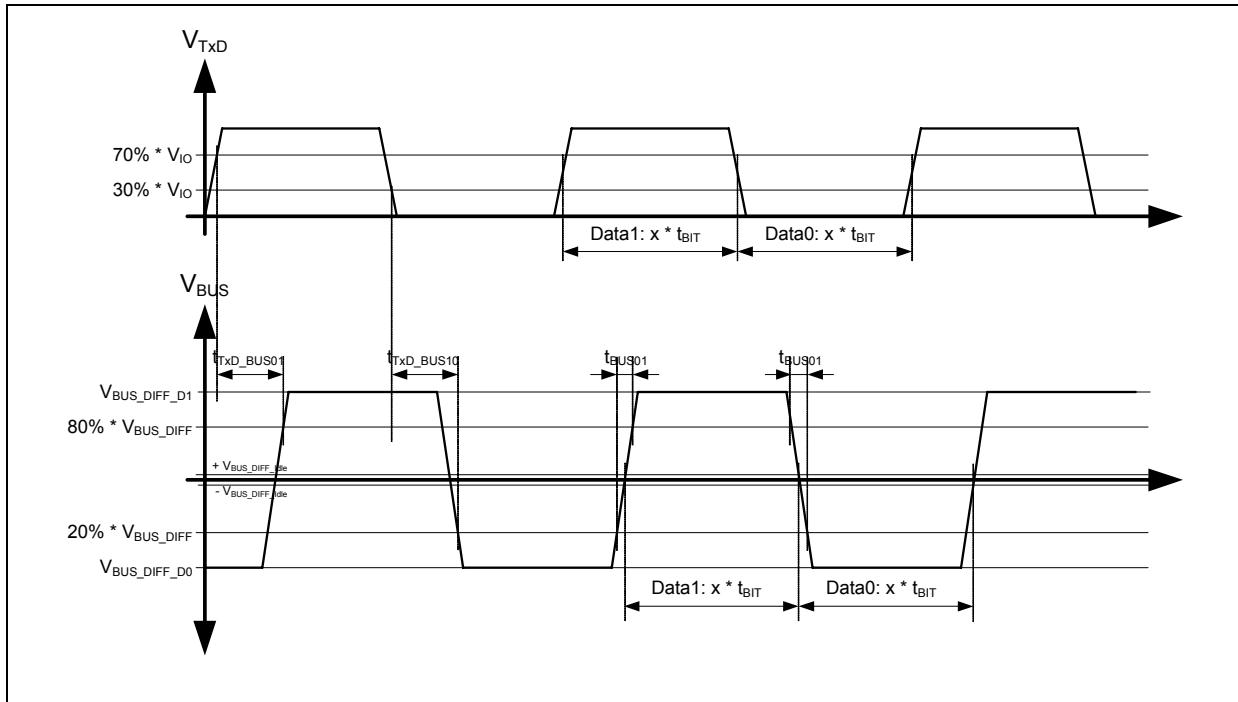

Figure 11. Transmitter characteristics ( $TxEN \rightarrow BUS$ )

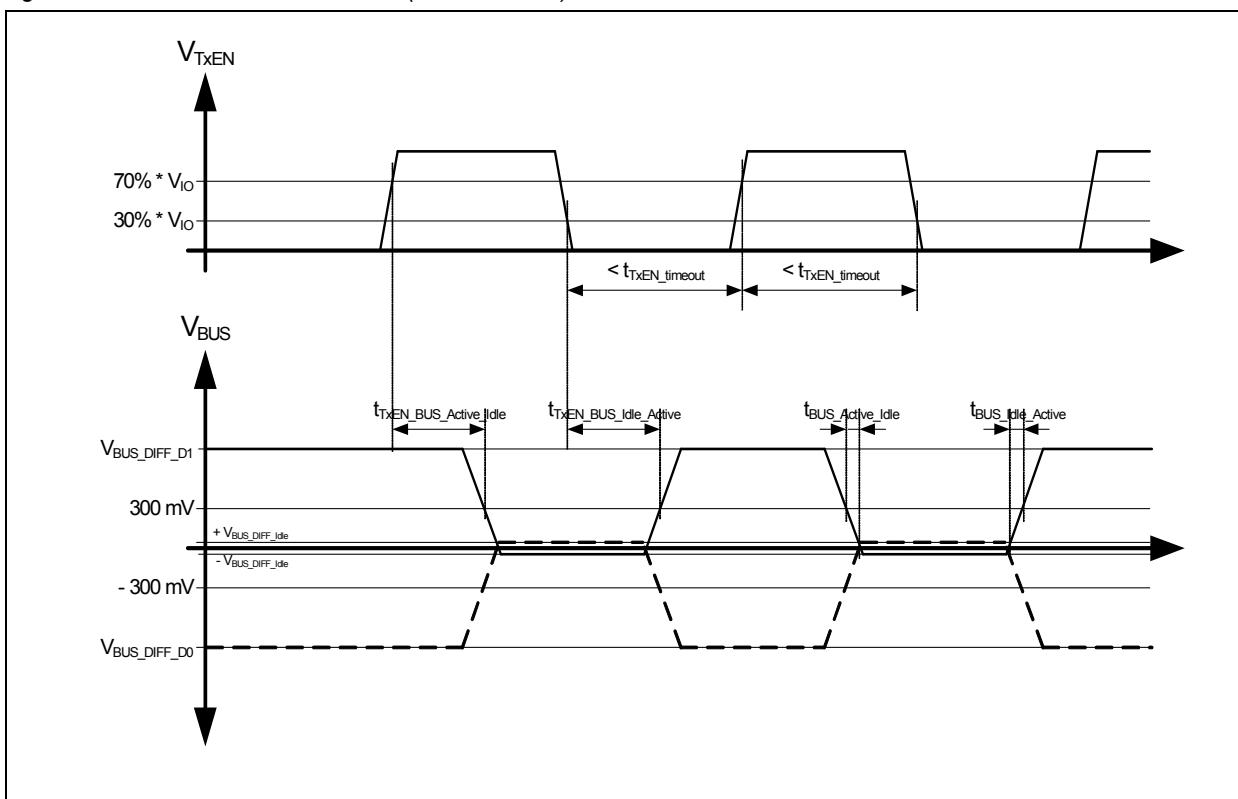

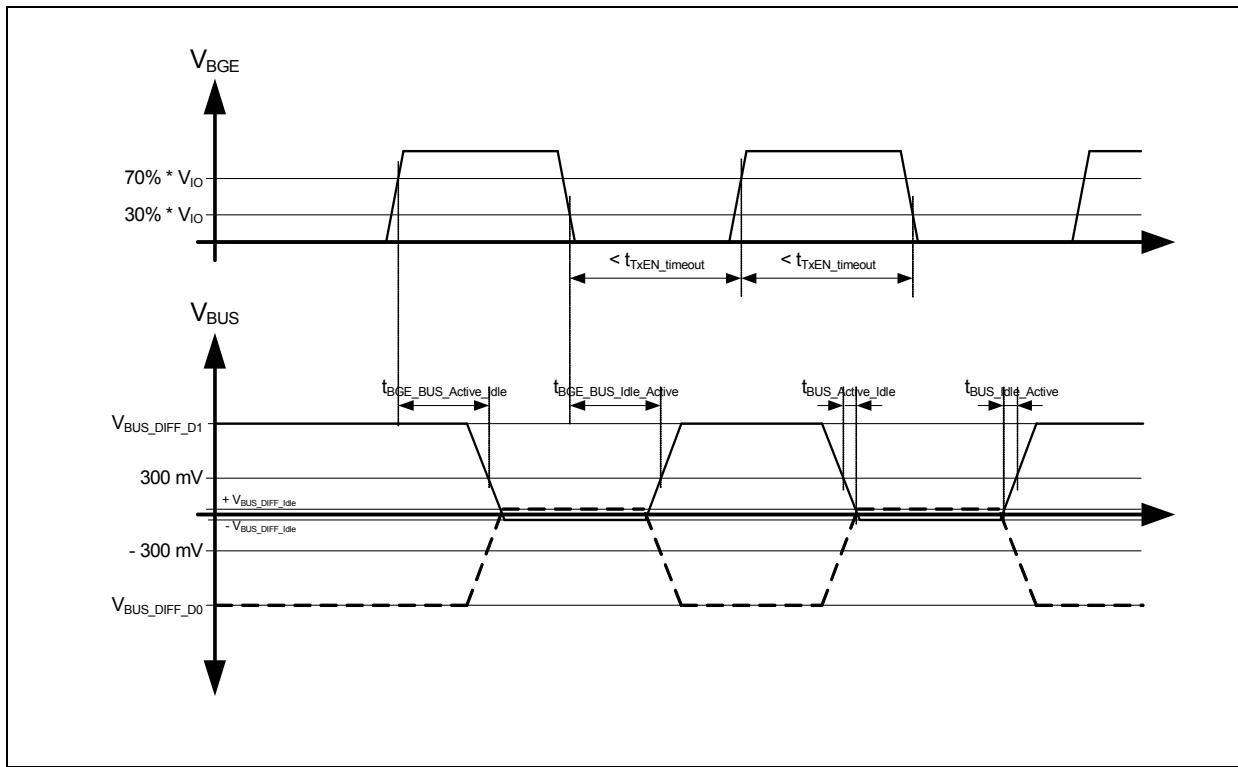

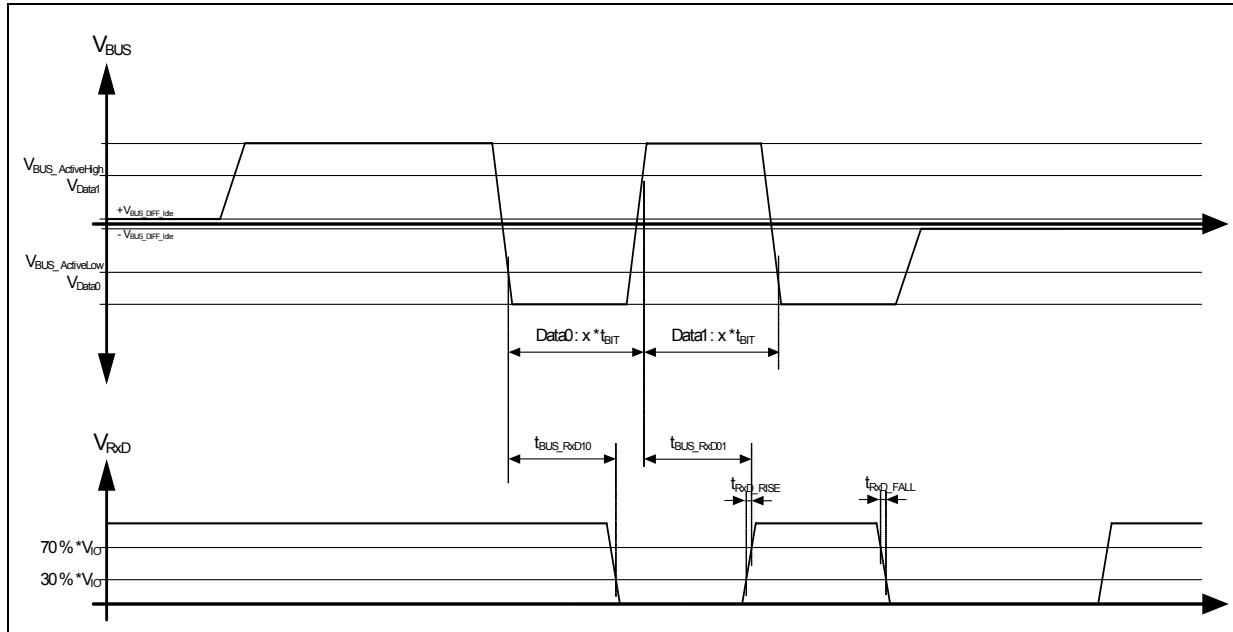

Figure 12. Timing characteristics ( $BGE \rightarrow BUS$ )

In NORMAL mode the transmitter drives on the bus Idle in case no data are transmitted. In STANDBY mode the transmitter drives Idle\_LP (idle low power) on the bus pins. In POWER OFF mode the bus pins shows Idle\_HZ (idle high impedance).

## Receiver

The receiver generates from the FlexRay differential bus voltage a digital signal on the RxD pin. RxD shows the data (Data0 and Data1). The receiver is only active in NORMAL mode.

*Figure 13. Timing characteristics of the bus signals to RxD*

### Bus activity and idle detection (only in NORMAL mode)

If the absolute differential bus voltage is higher than  $V_{BUSES\_ActiveHigh}$  and less than  $V_{BUSES\_ActiveLow}$  for a time longer than  $t_{BUSES\_IdleDetection}$ , bus Idle is detected, RxD is switched to logical high after a time  $t_{BUSES\_IdleReaction}$ .

If the absolute differential bus voltage is higher than  $V_{BUSES\_ActiveHigh}$  or lower than  $V_{BUSES\_ActiveLow}$  for a time longer than  $t_{BUSES\_ActivityDetection}$ , bus Activity is detected, RxD is following the detected bus data states as indicated below with a time  $t_{BUSES\_ActivityReaction}$ .

*Table 9. Logic table for receiver bus signal detection*

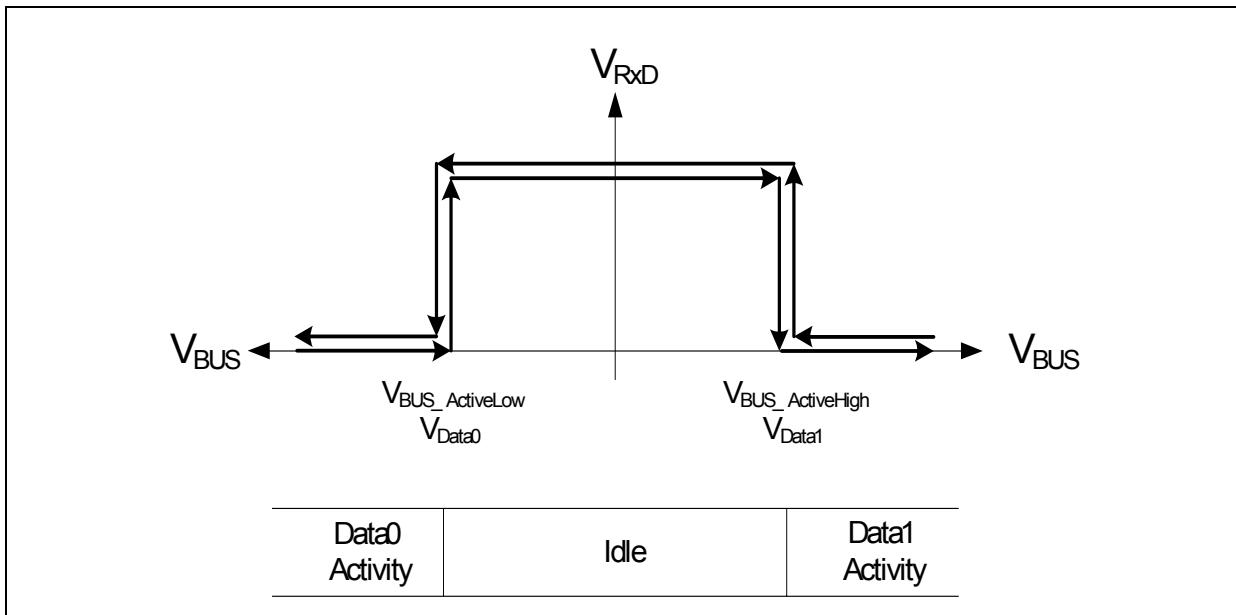

Receiver Operation mode	Bus signals	RxD
NORMAL mode	Idle	H
	Data0	L
	Data1	H

### Bus data detection (NORMAL mode)

If, after the activity detection the differential bus voltage is higher than  $V_{Data1}$ , RxD will be high after a time  $t_{BUSES\_RxD01}$ .

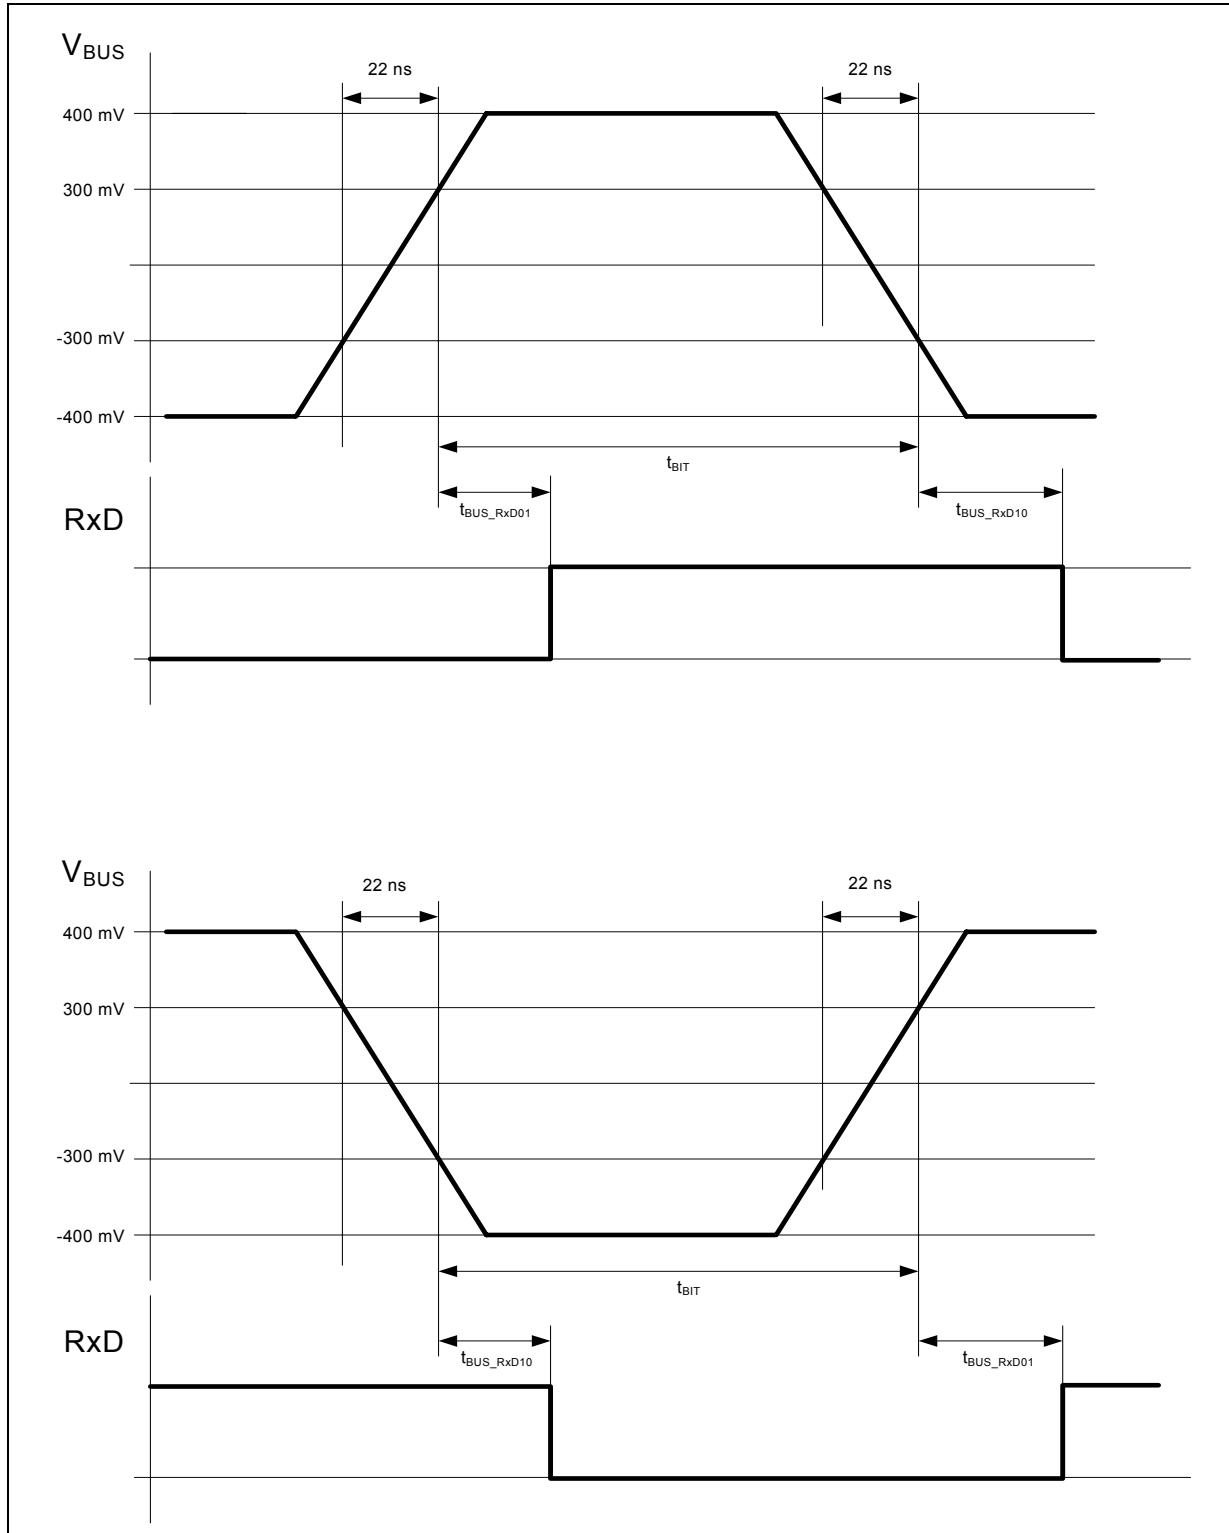

If, after the activity detection the differential bus voltage is lower than  $V_{Data0}$ , RxD will be low after a time  $t_{BUSES\_RxD10}$ .

## 9 Appendix

The following table shows the comparison of conventions used in AS8220A datasheet and FlexRay Electrical Physical Layer Specification V2.1 Rev. B.

*Table 10. Comparison table*

AS8220A Datasheet		FlexRay Electrical Physical Layer Specification V2.1 RevB	
Symbol	Parameter	Name	Description
<b>General Parameters</b>			
-	Battery Supply Voltage ( $V_{BAT}$ )	-	-
-	Supply Voltage ( $V_{CC}$ )	-	-
-	Supply Voltage ( $V_{IO}$ )	-	-
-	DC Voltage at EN, STBN, ERRN, TxD, RxD, TxEN, BGE, RxEN	-	-
-	DC Voltage on pin WAKE, INH1, INH2	-	-
-	DC Voltage at BP and BM	-	-
-	Input current (latchup immunity)	-	-
-	Electrostatic discharge at bus lines BP, BM, $V_{BAT}$ , WAKE	uESDExt	ESD protection on pins that lead to ECU external terminals
-	Electrostatic discharge	uESDint	ESD on all other pins
-	Transient voltage on BP, BM	-	-
-	Transient voltage on $V_{BAT}$	-	-
-	Total power dissipation (all supplies and outputs)	-	-
-	Storage temperature	-	-
-	Junction temperature	-	-
-	Package body temperature	-	-
-	Humidity non-condensing	-	-
<b>Supply Voltage</b>			
$T_{AMB}$	Ambient temperature	$T$	Ambient temperature
$V_{CC} - V_{IO}$	Difference of supplies	-	-
$I_{CC}$	$V_{CC}$ current consumption	-	-
$I_{IO}$	$V_{IO}$ current consumption	-	-
<b>State Transitions</b>			
$t_{STBN\_RxD}$	Delay STBN high to RxD high with wake flag set	-	-
$t_{STANDBY}$	go-to STANDBY hold time	-	-
<b>Transmitter</b>			
$V_{BUS\_DIFF\_D0}$	Differential bus voltage low in NORMAL mode (Data0)	-	-
$V_{BUS\_DIFF\_D1}$	Differential bus voltage high in NORMAL mode (Data1)	-	-

Table 10. Comparison table

IBM <sub>48VShortMax</sub>	Absolute max current when BM is shorted to 48 V	IBM <sub>BAT48VShortMax</sub>	Absolute maximum output current when shorted to 48V
t <sub>TxD_BUS01</sub>	Delay time from TxD to BUS positive edge	dBDTx10	Transmitter delay, negative edge
t <sub>TxD_BUS10</sub>	Delay time from TxD to BUS negative edge	dBDTx01	Transmitter delay, positive edge
t <sub>TxD_MISMATCH</sub>	Delay time from TxD to BUS mismatch	dTxAsym	Transmitter delay mismatch   dBDTx10 - dBDTx01
t <sub>BUS_10</sub>	Fall time differential bus voltage	dBusTx10	Fall time differential bus voltage (80% → 20%)
t <sub>BUS_01</sub>	Rise time differential bus voltage	dBusTx01	Rise time differential bus voltage (20% → 80%)

Table 10. Comparison table

AS8220A Datasheet		FlexRay Electrical Physical Layer Specification V2.1 RevB	
Symbol	Parameter	Name	Description
$t_{TxEN\_BUS\_Idle\_Active}$	Delay time from TxEN to bus active	dBDTxia	Propagation delay idle → active
$t_{TxEN\_BUS\_Active\_Idle}$	Delay time from TxEN to bus idle	dBDTxai	Propagation delay active → idle
$t_{TxEN\_MISMATCH}$	Delay time from TxEN to bus mismatch	dBDTxDM	$  dBDTxia - dBDTxai  $
$t_{BGE\_BUS\_Idle\_Active}$	Delay time from BGE to bus active	dBDTxia	Propagation delay idle → active
$t_{BGE\_BUS\_Active\_Idle}$	Delay time from BGE to bus idle	dBDTXai	Propagation delay active → idle
$t_{BUS\_Idle\_Active}$	Differential bus voltage transition time: idle to active	dBusTxia	Transition time idle → active
$t_{BUS\_Active\_Idle}$	Differential bus voltage transition time: active to idle	dBusTxai	Transition time active → idle
$t_{TxEN\_timeout}$	TxEN timeout	-	-
<b>Receiver</b>			
$R_{BP}, R_{BM}$	BP, BM input resistance	RCM1, RCM2	Receiver common mode input resistance
$R_{DIFF}$	BP, BM differential input resistance	-	-
$V_{BPidle}, V_{BMidle}$	Idle voltage in NORMAL mode on pin BP,BM	uBias	Bus bias voltage during BD_Normal mode
$V_{BPidle\_low}, V_{BMidle\_low}$	Idle voltage in NORMAL mode on pin BP, BM	uBias	Bus bias voltage during low power modes
$I_{BPidle}$	Absolute idle output current on pin BP	-	-
$I_{BMidle}$	Absolute idle output current on pin BM	-	-
$I_{BPleak}, I_{BMLEak}$	Absolute leakage current, when not powered	iBPLeak, iBMLEak	Absolute leakage current, when not powered
$V_{BUSActiveHigh}$	Activity detection differential input voltage high	uBusActiveHigh	Upper receiver threshold for detecting activity
$V_{BUSActiveLow}$	Activity detection differential input voltage low	uBusActiveLow	Lower receiver threshold for detecting activity
$V_{Data1}$	Data1 detection differential input voltage	uData1	Receiver threshold for detecting Data_1
$V_{Data0}$	Data0 detection differential input voltage	uData0	Receiver threshold for detecting Data_0
$V_{DataErr}$	Mismatch between Data0 and Data1 differential input voltage	uData	Mismatch of receiver thresholds
$t_{BUS\_RxD10}$	Delay from bus to RxD negative edge	dBDRx10	Receiver delay, negative edge
$t_{BUS\_RxD01}$	Delay from bus to RxD positive edge	dBDRx01	Receiver delay, positive edge

Table 10. Comparison table

AS8220A Datasheet		FlexRay Electrical Physical Layer Specification V2.1 RevB	
Symbol	Parameter	Name	Description
$t_{BIT}$	Bit time	-	-
$t_{RxD\_ASYM}$	Delay time from bus to RxD mismatch	dRxAsym	Receiver delay mismatch   dBDRx10 – dBDRx01
$t_{BUSIdleDetection}$	Idle detection time	dIdleDetection	Filter-time for idle detection
$t_{BUSActivityDetection}$	Activity detection time	dActivityDetection	Filter-time for activity detection
$t_{BUSIdleReaction}$	Idle reaction time	dBDRxai	Idle reaction time
$t_{BUSActivityReaction}$	Activity reaction time	dBDRxia	Activity reaction time
