NOTES (WRITE CYCLE)

1. A write occurs during the overlap of a low $\overline{CS_1}$, a high CS₂ and a low $\overline{WE}$. A write begins at the latest transition among $\overline{CS_1}$ goes low, CS₂ going high and WE going low: A write ends at the earliest transition among CS₁ going high, CS₂ going low and WE going high, tWP is measured from the beginning of write to the end of write.
2. tCW is measured from the CS₁ going low or CS₂ going high to the end of write.
3. tAS is measured from the address valid to the beginning of write.
4. tWR is measured from the end of write to the address change. tWR applied in case a write ends as $\overline{CS_1}$ or $\overline{WE}$ going high tWR2 applied in case a write ends as CS₂ going to low.
