# Galvanically isolated high-speed CAN transceiver

Rev. 1 — 10 July 2013

**Product data sheet** 

## 1. General description

The TJF1052i is a high-speed CAN transceiver that provides a galvanically isolated interface between a Controller Area Network (CAN) protocol controller and the physical two-wire CAN bus. The TJF1052i is specifically targeted at industrial applications, where galvanic isolation barriers are needed between the high- and low-voltage parts.

**Safety:** Isolation is required for safety reasons, eg. to protect humans from electric shock or to prevent the electronics being damaged by high voltages.

**Signal integrity:** The isolator uses proprietary capacitive isolation technology to transmit and receive CAN signals. This technology enables more reliable data communications in noisy environments, such as electric pumps, elevators or industrial equipment.

**Performance:** The transceiver is designed for high-speed (up to 1 Mbit/s) CAN applications, supplying the differential transmit and receive capability to a CAN protocol controller in a microcontroller. Integrating the galvanic isolation along with the transceiver in the TJF1052i removes the need for stand-alone isolation. It also improves reliability and system performance parameters such as loop delay.

The TJF1052i belongs to the third generation of high-speed CAN transceivers from NXP Semiconductors, offering significant improvements over first- and second-generation devices. It offers improved ElectroMagnetic Compatibility (EMC) and ElectroStatic Discharge (ESD) performance, and also features ideal passive behavior to the CAN bus when the transceiver supply voltage is off.

The TJF1052i is an excellent choice for all types of industrial CAN networks where isolation is required for safety reasons or to enhance signal integrity in noisy environments.

#### 2. Features and benefits

#### 2.1 General

- Isolator and Transceiver integrated into a single SO16 package, reducing board space
- Flawless cooperation between the Isolator and the Transceiver
  - Fewer components improves reliability in applications
  - ◆ Guaranteed performance (eg. max loop delay <220 ns)
- Electrical transient immunity of 45 kV/μs (typ)
- ISO 11898-2 compliant
- Suitable for use in 12 V and 24 V systems; compatible with 3 V to 5 V microcontrollers
- Bus common mode voltage (V<sub>cm</sub>) = ±25 V
- Low ElectroMagnetic Emission (EME) and high ElectroMagnetic Immunity (EMI)

## Galvanically isolated high-speed CAN transceiver

## 2.2 Power management

- Functional behavior predictable under all supply conditions
- Transceiver disengages from the bus when not powered up (zero load)

#### 2.3 Protection

- Up to 5 kV (RMS) rated isolation
- Three versions available (1 kV, 2.5 kV and 5 kV)
- Voltage compliant with UL 1577 (pending), IEC 61010 and IEC 60950
- 5 kV (RMS) rated isolation voltage compliant with UL 1577, IEC 61010 and IEC 60950
- High ESD handling capability on the bus pins
- Transmit Data (TXD) dominant time-out function
- Undervoltage detection on supply pins

#### 6.1 Pinning

## 6.2 Pin description

Table 4. Pin description

Symbol	Pin	Description
$V_{DD1}$	1	supply voltage 1
GND1	2	ground supply 1[1]
TXD	3	transmit data input
n/c	4	not connected
RXD	5	receive data output; reads out data from the bus lines
n/c	6	not connected
GND1	7	ground supply 1[1]
GND1	8	ground supply 1[1]
GND2	9	ground supply 2[1]
GND2	10	ground supply 2[1]
$V_{DD2}$	11	supply voltage 2
CANL	12	LOW-level CAN bus line
CANH	13	HIGH-level CAN bus line
STB	14	Standby mode control input[2]
GND2	15	ground supply 2[1]
$V_{DD2}$	16	supply voltage 2

<sup>[1]</sup> All GND1 pins (pins 2, 7 and 8) should be connected together and to ground domain 1. All GND2 pins (pins 9, 10 and 15) should be connected together and to ground domain 2. Refer to the application notes for further information.

<sup>[2]</sup> Setting STB HIGH disables the CAN bus connection.

#### Galvanically isolated high-speed CAN transceiver

## 7. Functional description

#### 7.1 Operation

#### 7.1.1 Normal mode

During normal operation, the TJF1052i transceiver transmits and receives data via bus lines CANH and CANL (see <u>Figure 1</u> for the block diagram). The differential receiver converts the analog data on the bus lines into digital data, which is output on pin RXD. The slope of the output signals on the bus lines is controlled and optimized in a way that guarantees the lowest possible EME.

The isolator used in the TJF1052i is an AC device that employs on-off keying to guarantee the DC output state at all times. The states of TXD, RXD and the CAN bus at start-up, shut-down and during normal operation are described in <u>Table 5</u>.

Care should be taken regarding power sequencing if the device is used in networks that support remote wake-up (see Section 12 "Application information").

Table 5. Input/output states at start-up, shut-down and during normal operation

TXD	RXD	V <sub>DD1</sub>	V <sub>DD2</sub>	CAN	Comments
Н	Н	$>V_{uvd(VDD1)}$	$>V_{uvd(stb)VDD2)}$	recessive	Normal mode operation
L	L	$>V_{uvd(VDD1)}$	$>V_{uvd(stb)VDD2)}$	dominant	Normal mode with TXD dominant time-out active
X	Χ	unpowered	>V <sub>uvd(stb)</sub> VDD2)	dominant	dominant after $V_{DD1}$ power loss until TXD dominant timeout; recessive while $V_{DD2}$ is ramping up from an unpowered state
Χ	L	>V <sub>uvd(VDD1)</sub>	unpowered	disconnected	RXD transitions L-to-H when V <sub>DD2</sub> restored

## 7.1.2 Standby mode

Standby mode is provided to improve the response of the TJF1052i to an undervoltage on  $V_{DD2}$ . The microcontroller cannot switch the transceiver directly to Standby mode. The TJF1052i switches to Standby mode during  $V_{DD2}$  power-up and power-down. See Section 7.2.2 for a description of undervoltage protection on  $V_{DD2}$ .

#### 7.2 Fail-safe features

#### 7.2.1 TXD dominant time-out function

A 'TXD dominant time-out' timer is started when pin TXD goes LOW. If the LOW state on TXD persists for longer than  $t_{to(dom)TXD}$ , the transmitter is disabled, releasing the bus lines to recessive state. This function prevents a hardware and/or software application failure from driving the bus lines to a permanent dominant state (blocking all network communications). The TXD dominant time-out timer is reset by a positive edge on TXD. The TXD dominant time-out time also defines the minimum possible bit rate of 40 kbit/s.

#### 7.2.2 Undervoltage protection: V<sub>DD2</sub>

If the voltage on pin  $V_{DD2}$  falls below the standby threshold,  $V_{uvd(stb)(VDD2)}$ , the transceiver switches to Standby mode. In Standby mode, the transceiver is not able to transmit or receive data on the bus lines. The transmitter and the Normal mode receiver are switched off and the bus lines are biased to ground to minimize the supply current. The TJF1052i

#### Galvanically isolated high-speed CAN transceiver

will remain in Standby mode until  $V_{DD2}$  rises above  $V_{uvd(stb)(VDD2)}$  (max). The low-power receiver continues to monitor the bus while the TJF1052i is in Standby mode. Data on the bus is still reflected onto RXD, but the transfer speed is reduced.

If the voltage on  $V_{DD2}$  falls below the switch-off threshold,  $V_{uvd(swoff)(VDD2)}$ , the transceiver switches off and disengages from the bus (zero load). It is guaranteed to switch on again in Standby mode when  $V_{DD2}$  rises above  $V_{uvd(swoff)(VDD2)}$  (max).

## 7.2.3 Undervoltage protection: V<sub>DD1</sub>

If the voltage on pin  $V_{DD1}$  falls below the undervoltage detection threshold,  $V_{uvd(VDD1)}$ , the CAN bus switches to dominant state and the TXD dominant timeout timer is started. RXD will not go high again until the supply voltage has been restored on  $V_{DD1}$  ( $V_{DD1} > V_{uvd(VDD1)}$ ).

#### 7.2.4 Overtemperature protection

The output drivers are protected against overtemperature conditions. If the virtual junction temperature exceeds the shutdown junction temperature,  $T_{j(sd)}$ , the output drivers are disabled. They are enabled again when the virtual junction temperature falls below  $T_{j(sd)}$  and TXD is HIGH. Including the TXD condition ensures that output driver oscillation due to temperature drift is avoided.

## 7.3 Insulation characteristics and safety-related specifications

Table 6. Isolator characteristics

Symbol	Parameter	Conditions	N	<b>V</b> lin	Тур	Max	Unit
$d_{L(IO1)}$	minimum air gap		<u>[1]</u> 8	3.6	-	-	mm
$d_{L(IO2)}$	minimum external tracking		<u>[2]</u> 8	3.1	-	-	mm
R <sub>ins</sub>	insulation resistance	$V_{IO}$ = 500 V at $T_A$ = 125 °C	<u>[3]</u> 1	100	-	-	$G\Omega$
		$V_{IO}$ = 500 V at $T_A$ = 150 °C	<u>[3]</u> 1	10	-	-	$G\Omega$
-	pollution degree	-	2	2	-	-	-
-	material group (IEC 60664)		2	2	-	-	-

<sup>[1]</sup> Based on the measured data in the package outline. d<sub>L(IO1)</sub> is the clearance distance. Note that the clearance distance cannot be larger than the creepage distance (d<sub>L(IO2)</sub>).

<sup>[2]</sup> Based on the measured data in the package outline. d<sub>L(IO2)</sub> is the creepage distance. According to IEC 60950-1, normative annex F (also IEC60664 chapter 6.2, Example 11), the effective minimum external tracking is 1.0 mm less due to the presence of an intervening, unconnected conductive part.

<sup>[3]</sup> Guaranteed by design.

#### Galvanically isolated high-speed CAN transceiver

Table 7. Working voltages and isolation

Insulation Characteristics				
Parameter	Standard	TJF1052i/1	TJF1052i/2	TJF1052i/5
max. working insulation voltage	IEC 60664	300 V <sub>RMS</sub>	450 V <sub>RMS</sub>	800 V <sub>RMS</sub>
per IEC 60664 (V <sub>IORM</sub> )[1]		420 V <sub>peak</sub>	630 V <sub>peak</sub>	1125 V <sub>peak</sub>
max. transient overvoltage per IEC 60664 (V <sub>IOTM</sub> )[2]	$t_{TEST}$ = 1.2/50 $\mu s$ (certification) IEC 60664	2500 V <sub>peak</sub>	4000 V <sub>peak</sub>	6000 V <sub>peak</sub>
rated insulation voltage per	UL 1577			
UL 1577 (V <sub>ISO</sub> )	$t_{TEST} = 60 s$ (qualification)	1000 V <sub>RMS</sub>	2500 V <sub>RMS</sub>	5000 V <sub>RMS</sub>
	t <sub>TEST</sub> = 1 s (production)	1200 V <sub>RMS</sub>	3000 V <sub>RMS</sub>	6000 V <sub>RMS</sub>
Insulation classification in terr	ns of Overvoltage Category <sup>[3]</sup>			
Insulation type	Max. working voltage	TJF1052i/1	TJF1052i/2	TJF1052i/5
basic insulation[4]	≤150 V <sub>RMS</sub>	I - III	I - IV	I - IV
	≤300 V <sub>RMS</sub>	1 - 11	I - III	I - IV
	≤600 V <sub>RMS</sub>	I	I - II	I - III
	≤1000 V <sub>RMS</sub>	-	-	I - II
reinforced insulation[4]	≤150 V <sub>RMS</sub>	1 - 11	1 - 111	I - IV
	≤300 V <sub>RMS</sub>	I	1 - 11	1 - 111
	≤600 V <sub>RMS</sub>	-	I	1 - 11
	≤1000 V <sub>RMS</sub>	-	-	I

<sup>[1]</sup> The working voltage is the input-to-output voltage that can be applied without time limit. Which TJF1052i variant should be selected depends on the overvoltage category and the related insulation voltage.

Table 8. Safety approvals

Standard	File number
IEC 60950	CB NL-25981
IEC 61010-1 2nd Edition	CB NL-25982
UL1577	compliancy check pending

<sup>[2]</sup> UL stress test is performed at higher than IEC-specified levels.

<sup>[3]</sup> Based on transient overvoltages as indicated in IEC60664; creepage and clearance distances not taken into account.

<sup>[4]</sup> Reinforced insulation should have an impulse withstand voltage one step higher than that specified for basic insulation.

#### Galvanically isolated high-speed CAN transceiver

# 12. Application information

Isolated CAN applications are becoming more and more common in industrial automation processes. The TJF1052i is the ideal solution for use in DeviceNet networks or in applications that require an isolated CAN node. The device can also be used to isolate high-voltage on-demand pumps and motors in belt elimination projects.

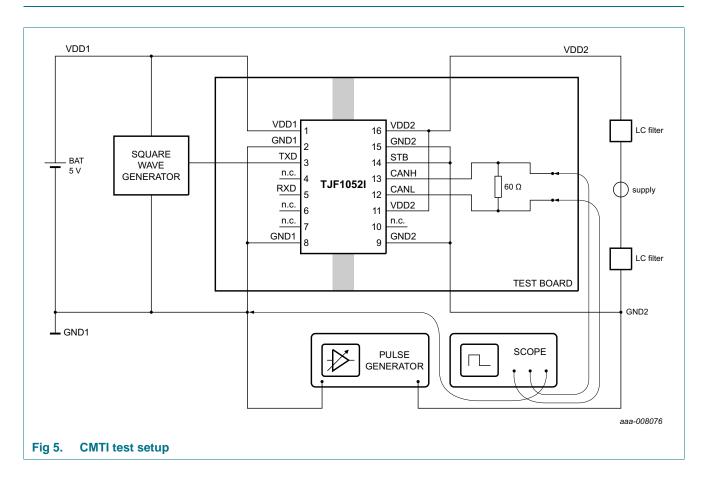

If the TJF1052i is used in a HS-CAN network that supports remote bus wake-up, the power-down sequence of the supplies must be managed properly to avoid a dominant pulse on the CAN bus.  $V_{DD2}$  should pass the minimum undervoltage threshold  $(V_{uvd(stb)(VDD2)(min)})$  before  $V_{DD1}$  falls below its maximum undervoltage detection threshold  $(V_{uvd(VDD1)(max)})$ . Power-up sequencing can happen in any order.

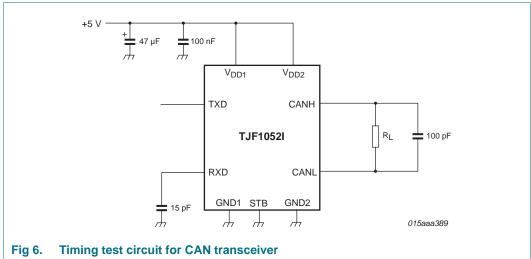

Digital inputs and outputs are 3 V compliant, allowing the TJF1052i to interface directly with 3 V and 5 V microcontrollers.

# 15. Handling information

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling ensure that the appropriate precautions are taken as described in *JESD625-A* or equivalent standards.

# 16. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365* "Surface mount reflow soldering description".

#### 16.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

## 16.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

#### 16.3 Wave soldering

Key characteristics in wave soldering are:

TJF1052I

#### Galvanically isolated high-speed CAN transceiver

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

## 16.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see <u>Figure 9</u>) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with <a href="Table 13">Table 13</a> and <a href="Table 14">14</a>

Table 13. SnPb eutectic process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)				
	Volume (mm³)				
	< 350	≥ 350			
< 2.5	235	220			
≥ 2.5	220	220			

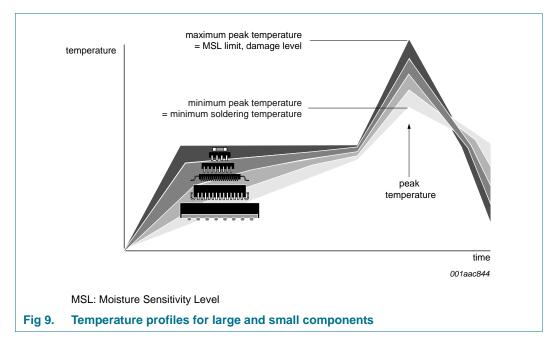

Table 14. Lead-free process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)						
	Volume (mm³)						
	< 350	350 to 2000	> 2000				
< 1.6	260	260	260				
1.6 to 2.5	260	250	245				
> 2.5	250	245	245				

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 9.

## Galvanically isolated high-speed CAN transceiver

For further information on temperature profiles, refer to Application Note *AN10365* "Surface mount reflow soldering description".

#### Galvanically isolated high-speed CAN transceiver

# 18. Legal information

#### 18.1 Data sheet status

Document status[1][2]	Product status[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

- [1] Please consult the most recently issued document before initiating or completing a design.
- [2] The term 'short data sheet' is explained in section "Definitions"
- [3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

#### 18.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

#### 18.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <a href="http://www.nxp.com/profile/terms">http://www.nxp.com/profile/terms</a>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Quick reference data** — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the

product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
