## 1. Overview

### 1.1 Features

The M16C/63 Group microcomputer (MCU) incorporates the M16C/60 Series CPU core and flash memory, employing sophisticated instructions for a high level of efficiency. This MCU has 1 MB of address space (expandable to 4 MB), and it is capable of executing instructions at high speed. In addition, the CPU core boasts a multiplier for high-speed operation processing.

This MCU consumes low power, and supports operating modes that allow additional power control. The MCU also uses an anti-noise configuration to reduce emissions of electromagnetic noise and is designed to withstand electromagnetic interference (EMI). By integrating many of the peripheral functions, including the multifunction timer and serial interface, the number of system components has been reduced.

#### 1.1.1 Applications

This MCU can be used in audio components, cameras, televisions, household appliances, office equipment, communication devices, mobile devices, industrial equipment, and other applications.

## 2. Central Processing Unit (CPU)

Figure 2.1 shows the CPU registers. Seven registers (R0, R1, R2, R3, A0, A1, and FB) out of 13 compose a register bank, and there are two register banks.

**Figure 2.1 CPU Registers**

### 2.1 Data Registers (R0, R1, R2, and R3)

R0, R1, R2, and R3 are 16-bit registers used for transfer, arithmetic, and logic operations. R0 and R1 can be split into high-order (R0H/R1H) and low-order (R0L/R1L) bits to be used separately as 8-bit data registers.

R0 can be combined with R2, and R3 can be combined with R1 and be used as 32-bit data registers R2R0 and R3R1, respectively.

## 2.2 Address Registers (A0 and A1)

A0 and A1 are 16-bit registers used for indirect addressing, relative addressing, transfer, arithmetic, and logic operations. A0 can be combined with A1 and used as a 32-bit address register (A1A0).

## 2.3 Frame Base Register (FB)

FB is a 16-bit register that is used for FB relative addressing.

## 2.4 Interrupt Table Register (INTB)

INTB is a 20-bit register that indicates the start address of a relocatable interrupt vector table.

## 2.5 Program Counter (PC)

The PC is 20 bits wide and indicates the address of the next instruction to be executed.

## 2.6 User Stack Pointer (USP) and Interrupt Stack Pointer (ISP)

The USP and ISP stack pointers (SP) are each comprised of 16 bits. The U flag is used to switch between USP and ISP.

## 2.7 Static Base Register (SB)

SB is a 16-bit register used for SB relative addressing.

## 2.8 Flag Register (FLG)

FLG is an 11-bit register that indicates the CPU state.

### 2.8.1 Carry Flag (C Flag)

The C flag retains a carry, borrow, or shift-out bit generated by the arithmetic/logic unit.

### 2.8.2 Debug Flag (D Flag)

The D flag is for debugging only. Set it to 0.

### 2.8.3 Zero Flag (Z Flag)

The Z flag becomes 1 when an arithmetic operation results in 0. Otherwise, it becomes 0.

### 2.8.4 Sign Flag (S Flag)

The S flag becomes 1 when an arithmetic operation results in a negative value. Otherwise, it becomes 0.

### 2.8.5 Register Bank Select Flag (B Flag)

Register bank 0 is selected when the B flag is 0. Register bank 1 is selected when this flag is 1.

### 2.8.6 Overflow Flag (O Flag)

The O flag becomes 1 when an arithmetic operation results in an overflow. Otherwise, it becomes 0.

### 2.8.7 Interrupt Enable Flag (I Flag)

The I flag enables maskable interrupts.

Maskable interrupts are disabled when the I flag is 0, and enabled when it is 1. The I flag becomes 0 when an interrupt request is accepted.

### **2.8.8 Stack Pointer Select Flag (U Flag)**

ISP is selected when the U flag is 0. USP is selected when the U flag is 1.

The U flag becomes 0 when a hardware interrupt request is accepted, or the INT instruction of software interrupt number 0 to 31 is executed.

### **2.8.9 Processor Interrupt Priority Level (IPL)**

IPL is 3 bits wide and assigns processor interrupt priority levels from 0 to 7.

If a requested interrupt has higher priority than IPL, the interrupt request is enabled.

### **2.8.10 Reserved Areas**

Only set these bits to 0. The read value is undefined.

### 3. Address Space

#### 3.1 Address Space

The M16C/63 Group has a 1 MB address space from 00000h to FFFFFh. Address space is expandable to 4 MB with the memory area expansion function. Addresses 40000h to BFFFFh can be used as external areas from bank 0 to bank 7. Figure 3.1 shows the Address Space. Areas that can be accessed vary depending on processor mode and the status of each control bit.

Figure 3.1 Address Space

### 3.2 Memory Map

Special function registers (SFRs) are allocated from address 00000h to 003FFh and from 0D000h to 0D7FFh. Peripheral function control registers are located here. All blank areas within SFRs are reserved. Do not access these areas.

Internal RAM is allocated from address 00400h and higher, with 10 KB of internal RAM allocated from 00400h to 02BFFh. Internal RAM is used not only for data storage, but also for the stack area when subroutines are called or when an interrupt request is accepted.

The internal ROM is flash memory. Three internal ROM areas are available: data flash, program ROM 1, and program ROM 2.

The data flash is allocated from 0E000h to 0FFFFh. This data flash area is mostly used for data storage, but can also store programs.

Program ROM 2 is allocated from 10000h to 13FFFh. Program ROM 1 is allocated from FFFFFh and lower, with the 64-KB program ROM 1 area allocated from address F0000h to FFFFFh.

The special page vectors are allocated from FFE00h to FFFD7h. They are used for the JMPS and JSRS instructions. Refer to the M16C/60, M16C/20, M16C/Tiny Series Software Manual for details.

The fixed vector table for interrupts is allocated from FFFDCh to FFFFFh.

The 256 bytes beginning with the start address set in the INTB register compose the relocatable vector table for interrupts.

Figure 3.2 shows the Memory Map.

Figure 3.2 Memory Map

### 3.3 Accessible Area in Each Mode

Areas that can be accessed vary depending on processor mode and the status of each control bit. Figure 3.3 shows the Accessible Area in Each Mode.

In single-chip mode, the SFRs, internal RAM, and internal ROM can be accessed.

In memory expansion mode, the SFRs, internal RAM, internal ROM, and external areas can be accessed. Address space is expandable to 4 MB with the memory area expansion function.

In microprocessor mode, the SFRs, internal RAM, and external areas can be accessed. Address space is expandable to 4 MB with the memory area expansion function. Allocate ROM to the fixed vector table from FFFDCh to FFFFFh.

- The blank areas are reserved. No access is allowed.
- Software reset, watchdog timer reset, oscillator stop detect reset, voltage monitor 1 reset, and voltage monitor 2 reset do not affect the following bits and registers: the VCR1 register, the VCR2 register, and bits PM01 and PM00 in the PM0 register.
- Oscillator stop detect reset does not affect bits CM20, CM21, and CM27.
- The state of bits in the RSTFR register depends on the reset type.
- This is the reset value when the LVDAS bit of address OFS1 is 1 during hardware reset.
- This is the reset value after voltage monitor 0 reset, power-on reset, and when the LVDAS bit of address OFS1 is 0 during hardware reset.

## 4.2 Notes on SFRs

### 4.2.1 Register Settings

Table 4.17 lists Registers with Write-Only Bits and registers whose function differs between reading and writing. Set these registers with immediate values. When establishing the next value by altering the existing value, write the existing value to the RAM as well as to the register. Transfer the next value to the register after making changes in the RAM.

Notes:

- Definition of program and erase cycles:  
The program and erase cycles refer to the number of per-block erasures. If the program and erase cycles are n ( $n = 1,000$ ), each block can be erased n times. For example, if a 64 Kbyte block is erased after writing two word data 16,384 times, each to a different address, this counts as one program and erase cycles. Data cannot be written to the same address more than once without erasing the block (rewrite prohibited).
- Cycles to guarantee all electrical characteristics after program and erase. (1 to Min. value can be guaranteed).
- In a system that executes multiple programming operations, the actual erasure count can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. It is advisable to retain data on the erasure cycles of each block and limit the number of erase operations to a certain number.
- If an error occurs during block erase, attempt to execute the clear status register command, then execute the block erase command at least three times until the erase error does not occur.
- Customers desiring program/erase failure rate information should contact their Renesas technical support representative.
- The data hold time includes time that the power supply is off or the clock is not supplied.
- After an erase start or erase restart, if an interval of at least 20 ms is not set before the next suspend request, the erase sequence cannot be completed.

## Notes:

- Definition of program and erase cycles  
The program and erase cycles refer to the number of per-block erasures.  
If the program and erase cycles are  $n$  ( $n = 10,000$ ), each block can be erased  $n$  times.  
For example, if a 4 Kbyte block is erased after writing two word data 1,024 times, each to a different address, this counts as one program and erase cycles. Data cannot be written to the same address more than once without erasing the block (rewrite prohibited).
- Cycles to guarantee all electrical characteristics after program and erase. (1 to Min. value can be guaranteed).
- In a system that executes multiple programming operations, the actual erasure count can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. For example, when programming groups of 16 bytes, the effective number of rewrites can be minimized by programming up to 256 groups before erasing them all in one operation. In addition, averaging the erasure cycles between blocks A and B can further reduce the actual erasure cycles. It is also advisable to retain data on the erasure cycles of each block and limit the number of erase operations to a certain number.
- If an error occurs during block erase, attempt to execute the clear status register command, then execute the block erase command at least three times until the erase error does not occur.

$$\frac{0.5 \times 10^9}{f_{(\text{BCLK})}} - 40[\text{ns}] \quad f_{(\text{BCLK})} \text{ is } 12.5 \text{ MHz or less.}$$

2. Calculated according to the BCLK frequency as follows:

$$\frac{0.5 \times 10^9}{f_{(\text{BCLK})}} - 10[\text{ns}]$$

This standard value shows the timing when the output is off, and does not show hold time of data bus.

Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value.

Hold time of data bus is expressed in

$$t = -CR \times \ln(1 - V_{OL}/V_{CC2})$$

by a circuit of the right figure.

For example, when  $V_{OL} = 0.2V_{CC2}$ ,  $C = 30 \text{ pF}$ ,  $R = 1 \text{ k}\Omega$ ,

hold time of output low level is

$$t = -30 \text{ pF} \times 1 \text{ k}\Omega \times \ln(1 - 0.2V_{CC2}/V_{CC2})$$

$$= 6.7 \text{ ns.}$$

1. Calculated according to the BCLK frequency as follows:

$$\frac{(n - 0.5) \times 10^9}{f_{(BCLK)}} - 40 [ns] \quad n \text{ is } 3 \text{ for } 2\phi + 3\phi, 4 \text{ for } 2\phi + 4\phi, 4 \text{ for } 3\phi + 4\phi, \text{ and } 5 \text{ for } 4\phi + 5\phi.$$

2. Calculated according to the BCLK frequency as follows:

$$\frac{0.5 \times 10^9}{f_{(BCLK)}} - 10 [ns]$$

3. This standard value shows the timing when the output is off, and does not show hold time of data bus. Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value. Hold time of data bus is expressed in  $t = -CR \times \ln(1 - V_{OL}/V_{CC2})$  by a circuit of the right figure. For example, when  $V_{OL} = 0.2V_{CC2}$ ,  $C = 30 \text{ pF}$ ,  $R = 1 \text{ k}\Omega$ , hold time of output low level is  $t = -30 \text{ pF} \times 1 \text{ k}\Omega \times \ln(1 - 0.2V_{CC2}/V_{CC2}) = 6.7 \text{ ns}$ .

1. Calculated according to the BCLK frequency as follows:

$$\frac{n \times 10^9}{f_{(BCLK)}} - 40 [ns] \quad n \text{ is } 3 \text{ for } 2\phi + 3\phi, 4 \text{ for } 2\phi + 4\phi, 4 \text{ for } 3\phi + 4\phi, \text{ and } 5 \text{ for } 4\phi + 5\phi.$$

2. Calculated according to the BCLK frequency as follows:

$$\frac{m \times 10^9}{f_{(BCLK)}} - 10 [ns] \quad m \text{ is } 1 \text{ when } 1 \text{ recovery cycle is inserted, } 2 \text{ when } 2 \text{ recovery cycles are inserted, and } 3 \text{ when } 3 \text{ recovery cycles are inserted.}$$

3. This standard value shows the timing when the output is off, and does not show hold time of data bus.

Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value.

Hold time of data bus is expressed in

$$t = -CR \times \ln(1 - V_{OL}/V_{CC2})$$

by a circuit of the right figure.

For example, when  $V_{OL} = 0.2V_{CC2}$ ,  $C = 30 \text{ pF}$ ,  $R = 1 \text{ k}\Omega$ , hold time of output low level is

$$t = -30 \text{ pF} \times 1 \text{ k}\Omega \times \ln(1 - 0.2V_{CC2}/V_{CC2})$$

$$= 6.7 \text{ ns.}$$

4. Calculated according to the BCLK frequency as follows:

$$\frac{m \times 10^9}{f_{(BCLK)}} + 10 [ns] \quad m \text{ is } 1 \text{ when } 1 \text{ recovery cycle is inserted, } 2 \text{ when } 2 \text{ recovery cycles are inserted, and } 3 \text{ when } 3 \text{ recovery cycles are inserted.}$$

Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
