
HA17339/A Series

Quadruple Comparators

HITACHI

ADE-204-065A (Z)

Rev. 1

Mar. 2001

Description

The HA17339A and HA17339 series products are comparators designed for general purpose, especially for power control systems.

These ICs operate from a single power-supply voltage over a wide range of voltages, and feature a reduced power-supply current since the supply current is independent of the supply voltage.

These comparators have the merit which ground is included in the common-mode input voltage range at a single-voltage power supply operation. These products have a wide range of applications, including limit comparators, simple A/D converters, pulse/square-wave/time delay generators, wide range VCO circuits, MOS clock timers, multivibrators, and high-voltage logic gates.

Features

- Wide power-supply voltage range: 2 to 36 V
- Very low supply current: 0.8 mA
- Low input bias current: 25 nA
- Low input offset current: 5 nA
- Low input offset voltage: 2 mV
- The common-mode input voltage range includes ground.
- Low output saturation voltage: 1 mV (5 μ A), 70 mV (1 mA)
- Output voltages compatible with CMOS logic systems

HA17339/A Series

Features only for “A” series

- Low electro-magnetic susceptibility

Ordering Information

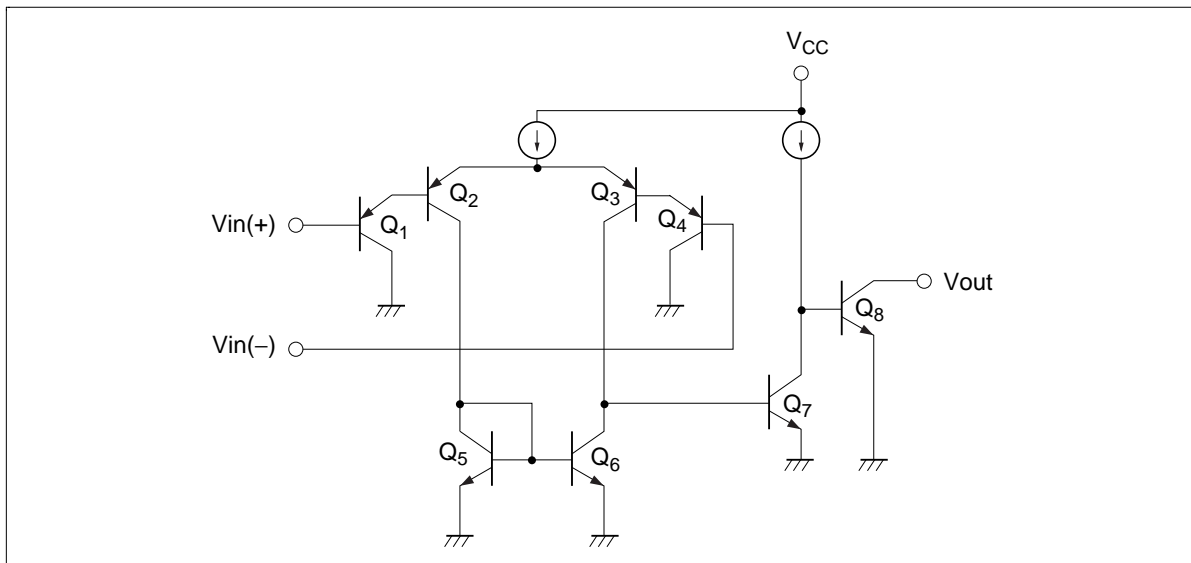

Type No.	Application	Package
HA17339AP	Industrial use	DP-14
HA17339ARP	Commercial use	FP-14DN
HA17339AFP		FP-14DA
HA17339	Commercial use	DP-14
HA17339F		FP-14DA

HITACHI

Pin Arrangement

Circuit Structure (1/4)

Absolute Maximum Ratings (Ta = 25°C)

Item	Symbol	Ratings					Unit
		17339AP	17339AFP	17339ARP	17339	17339F	
Power supply voltage	V _{CC}	36	36	36	36	36	V
Differential input voltage	V _{in(diff)}	±V _{CC}	±V _{CC}	±V _{CC}	±V _{CC}	±V _{CC}	V
Input voltage	V _{in}	-0.3 to +V _{CC}	-0.3 to +V _{CC}	-0.3 to +V _{CC}	-0.3 to +V _{CC}	-0.3 to +V _{CC}	V
Output current	I _{out} *2	20	20	20	20	20	mA
Allowable power dissipation	P _T	625 *1	625 *3	625 *3	625 *1	625 *3	mW
Operating temperature	T _{opr}	-40 to +85	-40 to +85	-40 to +85	-20 to +75	-20 to +75	°C
Storage temperature	T _{stg}	-55 to +125	-55 to +125	-55 to +125	-55 to +125	-55 to +125	°C
Output pin voltage	V _{out}	36	36	36	36	36	V

- Notes: 1. These are the allowable values up to Ta = 50°C. Derate by 8.3 mW/°C above that temperature.
 2. These products can be destroyed if the output and V_{CC} are shorted together. The maximum output current is the allowable value for continuous operation.
 3. T_{jmax} = θ_{j-a} · P_{c,max} + Ta (θ_{j-a}; Thermal resistor between junction and ambient at set board use).

The wiring density and the material of the set board must be chosen for thermal conductance of efficacy board.

And P_{c,max} cannot be over the value of P_T.

- a. Class epoxy board of 10% wiring density
 b. Class epoxy board of 30% wiring density

Electrical Characteristics ($V_{CC} = 5\text{ V}$, $T_a = 25^\circ\text{C}$)

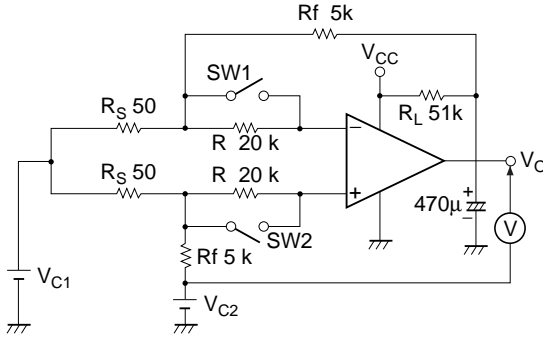

Item	Symbol	Min	Typ	Max	Unit	Test Condition
Input offset voltage	V_{IO}	—	2	7	mV	Output switching point: when $V_O = 1.4\text{V}$, $R_S = 0\Omega$
Input bias current	I_{IB}	—	25	250	nA	$I_{IN(+)}$ or $I_{IN(-)}$
Input offset current	I_{IO}	—	5	50	nA	$I_{IN(+)} - I_{IN(-)}$
Common-mode input voltage *1	V_{CM}	0	—	$V_{CC} - 1.5$	V	
Supply current	I_{CC}	—	0.8	2	mA	$R_L = \infty$
Voltage Gain	A_V	—	200	—	V/mV	$R_L = 15\text{k}\Omega$
Response time *2	t_R	—	1.3	—	μs	$V_{RL} = 5\text{V}$, $R_L = 5.1\text{k}\Omega$
Output sink current	I_{OSINK}	6	16	—	mA	$V_{IN(-)} = 1\text{V}$, $V_{IN(+)} = 0$, $V_O \leq 1.5\text{V}$
Output saturation voltage	$V_O \text{ sat}$	—	200	400	mV	$V_{IN(-)} = 1\text{V}$, $V_{IN(+)} = 0$, $I_{OSINK} = 3\text{mA}$
Output leakage current	I_{LO}	—	0.1	—	nA	$V_{IN(+)} = 1\text{V}$, $V_{IN(-)} = 0$, $V_O = 5\text{V}$

Notes: 1. Voltages more negative than -0.3 V are not allowed for the common-mode input voltage or for either one of the input signal voltages.

2. The stipulated response time is the value for a 100 mV input step voltage that has a 5 mV overdrive.

Test Circuits

1. Input offset voltage (V_{IO}), input offset current (I_{IO}), and Input bias current (I_{IB}) test circuit

SW1	SW2	Vout
On	On	V_{O1}
Off	Off	V_{O2}
On	Off	V_{O3}
Off	On	V_{O4}

$$V_{C1} = \frac{1}{2} V_{CC}$$

$$V_{C2} = 1.4V$$

$$V_{IO} = \frac{|V_{O1}|}{1 + R_f / R_S} \quad (\text{mV})$$

$$I_{IO} = \frac{|V_{O2} - V_{O1}|}{R(1 + R_f / R_S)} \quad (\text{nA})$$

$$I_{IB} = \frac{|V_{O4} - V_{O3}|}{2 \cdot R(1 + R_f / R_S)} \quad (\text{nA})$$

2. Output saturation voltage ($V_{O \text{ sat}}$) output sink current (I_{osink}), and common-mode input voltage (V_{CM}) test circuit

Item	V_{C1}	V_{C2}	V_{C3}	SW1	SW2	SW3	Unit
$V_{O \text{ sat}}$	2V	0V	—	1	1	1 at $V_{CC} = 5V$ 3 at $V_{CC} = 15V$	V
I_{osink}	2V	0V	1.5V	1	1	2	mA
V_{CM}	2V	-1 to V_{CC}	—	2	Switched between 1 and 2	3	V

3. Supply current (I_{CC}) test circuit

4. Voltage gain (A_V) test circuit ($R_L = 15k\Omega$)

$$A_V = 20 \log \frac{V_{O1} - V_{O2}}{V_{IN1} - V_{IN2}} \quad (\text{dB})$$

5. Response time (t_R) test circuit

t_R : $R_L = 5.1k\Omega$, a 100mV input step voltage that has a 5mV overdrive

- With V_{IN} not applied, set the switch SW to the off position and adjust V_R so that V_O is in the vicinity of 1.4V.
- Apply V_{IN} and turn the switch SW on.

HA17339/A Application Examples

The HA17339/A houses four independent comparators in a single package, and operates over a wide voltage range at low power from a single-voltage power supply. Since the common-mode input voltage range starts at the ground potential, the HA17339/A is particularly suited for single-voltage power supply applications. This section presents several sample HA17339/A applications.

HA17339/A Application Notes

1. Square-Wave Oscillator

The circuit shown in figure one has the same structure as a single-voltage power supply astable multivibrator. Figure 2 shows the waveforms generated by this circuit.

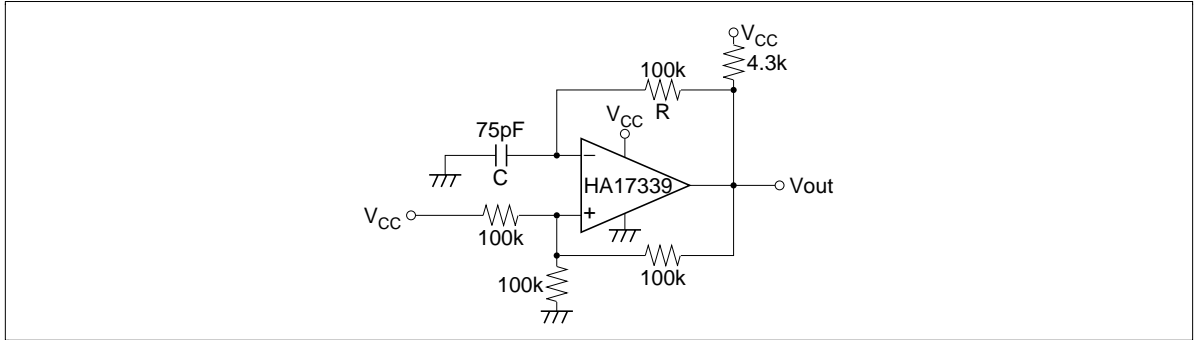

Figure 1 Square-Wave Oscillator

Figure 2 Operating Waveforms

2. Pulse Generator

The charge and discharge circuits in the circuit from figure 1 are separated by diodes in this circuit. (See figure 3.) This allows the pulse width and the duty cycle to be set independently. Figure 4 shows the waveforms generated by this circuit.

Figure 3 Pulse Generator

Horizontal: 2 V/div, Vertical: 20 μs/div, V_{CC} = 5 V Horizontal: 5 V/div, Vertical: 20 μs/div, V_{CC} = 15 V

Figure 4 Operating Waveforms

3. Voltage Controlled Oscillator

In the circuit in figure 5, comparator A₁ operates as an integrator, A₂ operates as a comparator with hysteresis, and A₃ operates as the switch that controls the oscillator frequency. If the output Vout1 is at the low level, the A₃ output will go to the low level and the A1 inverting input will become a lower level than the A1 noninverting input. The A1 output will integrate this state and its output will increase towards the high level. When the output of the integrator A₁ exceeds the level on the comparator A₂ inverting input, A₂ inverts to the high level and both the output Vout1 and the A₃ output go to the high level. This causes the integrator to integrate a negative state, resulting in its output decreasing towards the low level. Then, when the A₁ output level becomes lower than the level on the A₂ noninverting input, the output Vout1 is once again inverted to the low level. This operation generates a square wave on Vout1 and a triangular wave on Vout2.

Figure 5 Voltage Controlled Oscillator

4. Basic Comparator

The circuit shown in figure 6 is a basic comparator. When the input voltage V_{IN} exceeds the reference voltage V_{REF} , the output goes to the high level.

Figure 6 Basic Comparator

5. Noninverting Comparator (with Hysteresis)

Assuming $+V_{IN}$ is $0V$, when V_{REF} is applied to the inverting input, the output will go to the low level (approximately $0V$). If the voltage applied to $+V_{IN}$ is gradually increased, the output will go high when the value of the noninverting input, $+V_{IN} \times R_2 / (R_1 + R_2)$, exceeds $+V_{REF}$. Next, if $+V_{IN}$ is gradually lowered, V_{out} will be inverted to the low level once again when the value of the noninverting input, $(V_{out} - V_{IN}) \times R_1 / (R_1 + R_2)$, becomes lower than V_{REF} . With the circuit constants shown in figure 7, assuming $V_{CC} = 15V$ and $+V_{REF} = 6V$, the following formula can be derived, i.e. $+V_{IN} \times 10M / (5.1M + 10M) > 6V$, and V_{out} will invert from low to high when $+V_{IN}$ is $> 9.06V$.

$$(V_{out} - V_{IN}) \times \frac{R_1}{R_1 + R_2} + V_{IN} < 6V$$

(Assuming $V_{out} = 15V$)

When $+V_{IN}$ is lowered, the output will invert from high to low when $+V_{IN} < 1.41V$. Therefore this circuit has a hysteresis of $7.65V$. Figure 8 shows the input characteristics.

Figure 7 Noninverting Comparator

Figure 8 Noninverting Comparator I/O Transfer Characteristics

6. Inverting Comparator (with Hysteresis)

In this circuit, the output V_{out} inverts from high to low when $+V_{IN} > (V_{CC} + V_{out})/3$. Similarly, the output V_{out} inverts from low to high when $+V_{IN} < V_{CC}/3$. With the circuit constants shown in figure 9, assuming $V_{CC} = 15V$ and $V_{out} = 15V$, this circuit will have a 5V hysteresis. Figure 10 shows the I/O characteristics for the circuit in figure 9.

Figure 9 Inverting Comparator

Figure 10 Inverting Comparator I/O Transfer Characteristics

7. Zero-Cross Detector (Single-Voltage Power Supply)

In this circuit, the noninverting input will essentially be held at the potential determined by dividing V_{CC} with $100k\Omega$ and $10k\Omega$ resistors. When V_{IN} is 0V or higher, the output will be low, and when V_{IN} is negative, V_{out} will invert to the high level. (See figure 11.)

Cautions

1. Hitachi neither warrants nor grants licenses of any rights of Hitachi's or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Hitachi bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
3. Hitachi makes every attempt to ensure that its products are of high quality and reliability. However, contact Hitachi's sales office before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
4. Design your application so that the product is used within the ranges guaranteed by Hitachi particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Hitachi bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Hitachi product does not cause bodily injury, fire or other consequential damage due to operation of the Hitachi product.
5. This product is not designed to be radiation resistant.
6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Hitachi.
7. Contact Hitachi's sales office for any questions regarding this document or Hitachi semiconductor products.
