

MicroPower Microprocessor Reset Circuit

Features

- 1.2V to 6V Input Voltage Range
- Low Quiescent Current : less Than 1.5 μ A
- High accuracy detection threshold : $\pm 1.5\%$
- Fixed trimmed reset thresholds for 1.5V, 1.75V , 2.32V, 2.63V, 2.93V, 3.08V, 3.9V, 4.38V.
- Reset Timeout Period 250ms
- Available output configurations
 - Open-drain output
 - CMOS active high output
 - CMOS active low output
- SOT-23 , SOT-23-5 and SOT-89 packages
- No external components

Applications

- Computers
- Cell Phones
- Portable Electronics
- μ P Power Supply Monitoring

General Description

The APR3011/2/3 are designed to monitor voltage supplies in μ P and digital systems. The quiescent current is extremely low, typically 1.5 μ A, making it ideal for portable battery operated equipment. The APR3011/2/3 operate by monitoring the system power supply voltage. When the input voltage drops below a fixed threshold, the device asserts a reset signal for a fixed time period after Vcc rises above the fixed threshold. The APR3011/2/3 series is available with three output stage versions : APR3011 push-pull active low output, APR3012 push-pull active high output and APR3013 open drain active low output. They are also designed to reject fast line transient glitches on Vcc. The APR3011/2/3 are come in a miniature SOT-23, SOT-23-5, SOT-89 packages.

Part Number Description

Part Number	Part Description
APR3011	Reset Output Push Pull Active Low with Delay
APR3012	Reset Output Push Pull Active High with Delay
APR3013	Reset Output Open Drain Active Low with Delay

Electrical Characteristics

$V_{IN} = 5V$, $T_A = -40$ to $85^\circ C$ unless otherwise noted. Typical values are at $T_A=25^\circ C$, $V_{CC} = 5V$ for 4.38V versions, $V_{CC} = 3.3V$ for 3.08/2.93V versions, $V_{CC} = 3.0V$ for 2.63V. versions and $V_{CC} = 2.5V$ for 2.32V versions, $V_{CC} = 2.0V$ for 1.75V versions , $V_{CC} = 1.8V$ for 1.5V versions.

Symbol	Parameter	Test Conditions	APR3011/2/3			Unit
			Min.	Typ.	Max.	
V_{CC}	Supply Voltage		1.2	6	6	V
I_{CC}	Supply Current	$V_{CC}=1.5V \sim 6V$		1.5	4	μA
		$T_A=-40$ to $85^\circ C$		3	5	
V_{TH}	Reset Threshold	$T_A=25^\circ C$		$\pm 1.5\%$		
		$T_A=-40$ to $85^\circ C$		$\pm 2\%$		
V_{HYST}	Hysteresis Range			20		mV
T_{RTP}	Reset Timeout Period		150	250	350	ms
V_{OL}	Reset Output Low	$I_{SINK}=1.2mA$			0.5	V
V_{OH}	Reset Output High	$I_{SOURCE}=0.6mA$	0.8* V_{CC}			
T_D	V_{CC} to Reset Delay	$V_{CC}=V_{TH}$ to $(V_{TH}-100mV)$		25		μs
I_{LE}	Reset Output Leakage				0.5	μA

Application Information

V_{cc} Transient Rejection

The APR3011/2/3 have the function to reject the transient glitches from the power line. The Maximum Transient Duration vs. Reset Threshold Overdrive shows at Typical Characteristics. The transient voltage with the duration under the curve will not generate a reset signal, e.g. a transient of 100mV below the reset threshold voltage have the duration more than 35us, it will generate a reset signal. Connect a 0.1uF bypass capacitor to the V_{cc} pin can improve the transient immunity.

Figure 1. Ensuring RESET Valid to V_{cc} = 0 V

Reset Output

The APR3011/2/3 have 3 output stage versions: APR3001 is an active low push-pull output, when the V_{cc} drops below the reset threshold, the RESET output generates a low signal. APR3012 is an active high push-pull output, when the V_{cc} drops below the reset threshold, the RESET output generates a high signal (see Timing Chart). APR3013 is an active low open drain output, the RESET output must be connected a pull-up resistor to a supply voltage that is lower than 6V, it suits to use in multiple voltage systems (see Figure 2). The APR3011 RESET output is valid until the V_{cc}=1.2V, below 1.2V the IC is shutdown, and the output becomes a floating state. If it is a trouble, a resistor should be connected from reset output to ground to keep the reset output low (see Figure 1). For The APR3012, a pull-up resistor to V_{cc} is required to keep the valid reset output for V_{cc} below 1.2V.
