

High Voltage Synchronous Rectified Buck MOSFET Driver

ISL95808

The [ISL95808](#) is a high frequency, dual MOSFET driver with low shutdown current, optimized to drive two N-Channel power MOSFETs in a synchronous-rectified buck converter topology. It is especially suited for mobile computing applications that require high efficiency and excellent thermal performance. The driver, combined with an Intersil multiphase Buck PWM controller, forms a complete single-stage core-voltage regulator solution for advanced mobile microprocessors.

The ISL95808 features a 4A typical sinking current for the lower gate driver. This current is capable of holding the lower MOSFET gate off during the rising edge of the phase node. This prevents shoot-through power loss caused by the high dv/dt of phase voltages. The operating voltage matches the 30V breakdown voltage of the MOSFETs commonly used in mobile computer power supplies.

The ISL95808 also features a three-state PWM input. This PWM input, working together with Intersil's multiphase PWM controllers, will prevent negative voltage output during CPU shutdown. This feature eliminates a protective Schottky diode usually seen in microprocessor power systems.

MOSFET gates can be efficiently switched up to 2MHz using the ISL95808. Each driver is capable of driving a 3000pF load with propagation delays of 8ns and transition times under 10ns. Bootstrapping is implemented with an internal Schottky diode. This reduces system cost and complexity, while allowing for the use of higher performance MOSFETs. Adaptive shoot-through protection is integrated to prevent both MOSFETs from conducting simultaneously.

A diode emulation feature is integrated in the ISL95808 to enhance converter efficiency at light load conditions. This feature also allows for monotonic start-up into prebiased outputs. When diode emulation is enabled, the driver will allow discontinuous conduction mode by detecting when the inductor current reaches zero and subsequently turning off the low-side MOSFET gate.

The ISL95808 also features very low shutdown supply current (5V, 3µA) to ensure the low power consumption.

Features

- Dual MOSFET drivers for synchronous rectified bridge
- Adaptive shoot-through protection
- 0.5Ω ON-resistance and 4A sink current capability
- Supports high switching frequency up to 2MHz
 - Fast output rise and fall time
 - Low propagation delay
- Three-state PWM input for power stage shutdown
- Internal bootstrap Schottky diode
- Low shutdown supply current (5V, 3µA)
- Diode emulation for enhanced light-load efficiency and prebiased start-up applications
- VCC POR (Power-On Reset) feature integrated
- Low three-state shutdown hold-off time (typical 160ns)
- DFN package
- Pb-free (RoHS compliant)

Applications

- Core voltage supplies for Intel® and AMD™ mobile microprocessors
- High frequency low profile DC/DC converters
- High current low output voltage DC/DC converters
- High input voltage DC/DC converters

Ordering Information

PART NUMBER (Notes 1, 2, 3)	PART MARKING	TEMP. RANGE (°C)	TAPE AND REEL (UNITS)	PACKAGE (RoHS Compliant)	PKG. DWG. #
ISL95808HRZ-T	08	-10 to +100	6k	8 Ld 2x2 DFN	L8.2x2D
ISL95808IRZ-T	08I	-40 to +100	6k	8 Ld 2x2 DFN	L8.2x2D

NOTES:

- Please refer to [TB347](#) for details on reel specifications.
- These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- For Moisture Sensitivity Level (MSL), please see product information page for [ISL95808](#). For more information on MSL, please see tech brief [TB363](#).

Pin Configuration

Pin Descriptions

PIN NUMBER	PIN NAME	DESCRIPTION
1	UGATE	The UGATE pin is the upper gate drive output. Connect to the gate of high-side power N-Channel MOSFET.
2	BOOT	BOOT is the floating bootstrap supply pin for the upper gate drive. Connect the bootstrap capacitor between this pin and the PHASE pin. The bootstrap capacitor provides the charge to turn on the upper MOSFET. See "Internal Bootstrap Diode" on page 7 for guidance in choosing the appropriate capacitor value.
3	PWM	The PWM signal is the control input for the driver. The PWM signal can enter three distinct states during operation. See "Three-State PWM Input" on page 6 for further details. Connect this pin to the PWM output of the controller.
4	GND	GND is the ground pin for the IC.
5	LGATE	LGATE is the lower gate drive output. Connect to gate of the low-side power N-Channel MOSFET.
6	VCC	Connect the VCC pin to a +5V bias supply. Place a high quality bypass capacitor from this pin to GND. The VCC pin of the driver(s) and related VCC or +5V bias supply pin of the Intersil controller must share a common +5V supply.
7	FCCM	The FCCM pin enables or disables diode emulation. When FCCM is LOW, diode emulation is allowed. When FCCM is HIGH, continuous conduction mode is forced. See "Diode Emulation" on page 6 for more detail. High impedance on the input of FCCM will shut down ISL95808.
8	PHASE	Connect the PHASE pin to the source of the upper MOSFET and the drain of the lower MOSFET. This pin provides a return path for the upper gate driver.

ISL95808

Absolute Maximum Ratings

Supply Voltage (VCC)	-0.3V to 7V
Input Voltage (VFCCM, VPWM)	-0.3V to VCC + 0.3V
BOOT Voltage (VBOOT-GND)	-0.3V to 33V or 36V (<20ns)
BOOT To PHASE Voltage (VBOOT-PHASE)	-0.3V to 7V (DC) -0.3V to 9V (<10ns)
PHASE Voltage (Note 4)	(GND - 0.3V) to 30V GND - 8V (<20ns Pulse Width, 10μJ)
UGATE Voltage	VPHASE - 0.3V (DC) to VBOOT VPHASE - 5V (<20ns Pulse Width, 10μJ) to VBOOT
LGATE Voltage	GND - 0.3V (DC) to VCC + 0.3V GND - 2.5V (<20ns Pulse Width, 5μJ) to VCC + 0.3V

Thermal Information

Thermal Resistance (Typical)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
8 Ld 2x2 DFN Package (Notes 5, 6)	87	22
Maximum Storage Temperature Range	-65°C to +150°C	
Pb-free Reflow Profile	see TB493	

Recommended Operating Conditions

Ambient Temperature	
HRZ	-10°C to +100°C
IRZ	-40°C to +100°C
Maximum Operating Junction Temperature	+125°C
Supply Voltage, VCC	5V ±10%

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- The Phase Voltage is capable of withstanding -7V when the BOOT pin is at GND.
- θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief [TB379](#).
- For θ_{JC} , the "case temp" location is the center of the exposed metal pad on the package underside.

Electrical Specifications Recommended Operating Conditions, Unless Otherwise Noted. **Boldface limits apply across the operating temperature range $T_A = -40^\circ\text{C}$ to $+100^\circ\text{C}$ for Industrial (IRZ) and $T_A = -10^\circ\text{C}$ to $+100^\circ\text{C}$ for HI-Temp Commercial (HRZ).**

NOTES:

- Limits established by characterization and are not production tested.
- Parameters with MIN and/or MAX limits are 100% tested at $+25^\circ\text{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.

Typical Application With 2-Phase Converter

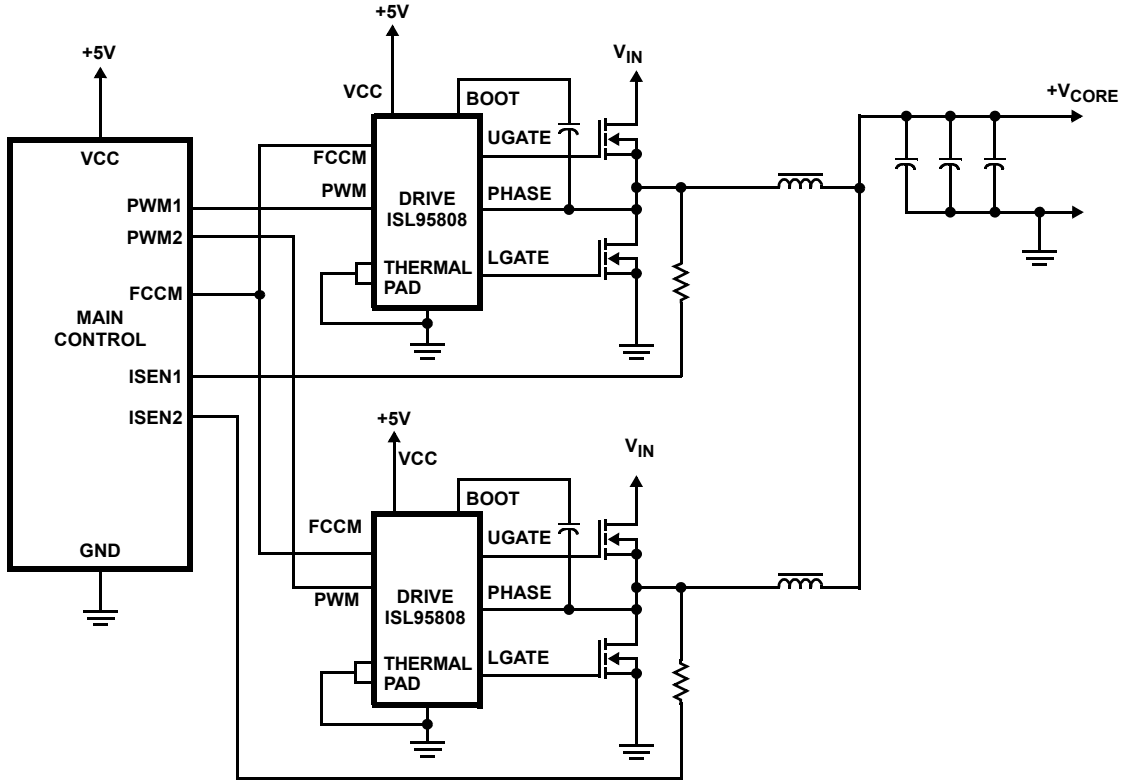

FIGURE 2. TYPICAL APPLICATION WITH 2-PHASE CONVERTER

PS4 Exit Timing Diagram

FIGURE 3. PS4 EXIT TIMING DIAGRAM

MOSFET gate-to-source voltage has dropped below a threshold of 1V, the LGATE is allowed to rise.

Internal Bootstrap Diode

This driver features an internal bootstrap Schottky diode. Simply adding an external capacitor across the Boot and Phase pins completes the bootstrap circuit.

The bootstrap capacitor must have a maximum voltage rating above the maximum battery voltage plus 5V. The bootstrap capacitor can be derived from [Equation 1](#):

$$C_{BOOT} \geq \frac{Q_{GATE}}{\Delta V_{BOOT}} \quad (EQ. 1)$$

Where Q_{GATE} is the amount of gate charge required to fully charge the gate of the upper MOSFET. The ΔV_{BOOT} term is defined as the allowable droop in the rail of the upper drive.

As an example, suppose an upper MOSFET has a gate charge, Q_{GATE} , of 25nC at 5V and also assume the droop in the drive voltage over a PWM cycle is 200mV. One will find that a bootstrap capacitance of at least 0.125 μ F is required. The next larger standard value capacitance is 0.15 μ F. A good quality ceramic capacitor is recommended.

FIGURE 5. BOOTSTRAP CAPACITANCE vs BOOT RIPPLE VOLTAGE

Power Dissipation

Package power dissipation is mainly a function of the switching frequency and total gate charge of the selected MOSFETs. Calculating the power dissipation in the driver for a desired application is critical to ensuring safe operation. Exceeding the maximum allowable power dissipation level will push the IC beyond the maximum recommended operating junction temperature of +125°C. When designing the driver into an application, it is recommended that the following calculation be performed to ensure safe operation at the desired frequency for the selected MOSFETs. The power dissipated by the driver is approximated, as shown in [Equation 2](#):

$$P = f_{SW}(1.5V_U Q_U + V_L Q_L) + I_{VCC} V_{CC} \quad (EQ. 2)$$

Where f_{SW} is the switching frequency of the PWM signal. V_U and V_L represent the upper and lower gate rail voltage. Q_U and Q_L is the upper and lower gate charge determined by MOSFET

selection and any external capacitance added to the gate pins. The $I_{VCC} V_{CC}$ product is the quiescent power of the driver and is typically negligible.

FIGURE 6. POWER DISSIPATION vs FREQUENCY

Layout Considerations

Reducing Phase Ring

The parasitic inductances of the PCB and power devices (both upper and lower FETs) could cause increased PHASE ringing, which may lead to voltages that exceed the absolute maximum rating of the devices. When PHASE rings below ground, the negative voltage could add charge to the bootstrap capacitor through the internal bootstrap diode. Under worst-case conditions, the added charge could overstress the Boot and/or Phase pins. To prevent this from happening, the user should perform a careful layout inspection to reduce trace inductances, and select low lead inductance MOSFETs and drivers. D²PAK and DPAK packaged MOSFETs have high parasitic lead inductances. If higher inductance MOSFETs must be used, a Schottky diode is recommended across the lower MOSFET to clamp negative phase ring.

A good layout would help reduce the ringing on the phase and gate nodes significantly:

- Avoid using vias for decoupling components where possible, especially in the Boot-to-Phase path. Little or no use of vias for VCC and GND is also recommended. Decoupling loops should be short.
- All power traces (UGATE, PHASE, LGATE, GND and VCC) should be short and wide, and avoid using vias. If vias must be used, two or more vias per layer transition is recommended.
- Keep the SOURCE of the upper FET as close as thermally possible to the DRAIN of the lower FET.
- Keep the connection in between the SOURCE of lower FET and power ground wide and short.
- Input capacitors should be placed as close to the DRAIN of the upper FET and the SOURCE of the lower FET as thermally possible.

ISL95808

Refer to Tech Brief [TB447](#) "Guidelines for Preventing Boot-to-Phase Stress on Half-Bridge MOSFET Driver ICs" for more information.

FCCM Trace Placement

FCCM trace should not be placed next to digital signal traces or PWM/PHASE traces from other channels in multiphase designs.

Thermal Management

For maximum thermal performance in high current, high switching frequency applications, connecting the thermal pad of the DFN part to the power ground with multiple vias is recommended. This heat spreading allows the part to achieve its full thermal potential.

Revision History The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest revision.

DATE	REVISION	CHANGE
May 25, 2016	FN8689.2	Additional information added on page 2 and page 6 relative to +5V supply being common between VCC of ISL95808 and Intersil controllers. On page 3 added AC rating for the Boot pin to existing DC rating.
June 29, 2015	FN8689.1	Removed additional information from DFN package bullet listed in features on page 1. Ordering Information Table on page 2 changed to reflect addition of IRZ rated product and updated product markings. Part marking updated for HRZ version. Electrical Spec table beginning on page 3 updated to reflect IRZ addition. Changed MIN value of "Forward Voltage" on page 3 from 0.50 to 0.43 Updated POD L8.2x2D with current version, changes are as follows: Tiebar Note 5 updated From: "Tiebar shown (if present) is a non-functional feature." To: "Tiebar shown (if present) is a non-functional feature and may be located on any of the 4 sides (or ends)."
October 24, 2014	FN8689.0	Initial Release

About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

Reliability reports are also available from our website at www.intersil.com/support.

For additional products, see www.intersil.com/en/products.html

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at www.intersil.com/en/support/qualandreliability.html

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.
