QPRO XQR4000XL Radiation Hardened FPGAs

DS071 (v2.0) March 7, 2014

Product Specification

XQR4000XL Series Features

- Radiation-hardened FPGAs for space and satellite applications
- Guaranteed total ionizing dose
- Latch-up immune
- Low soft upset rate
- Guaranteed to meet full electrical specifications over –55°C to +125°C
- Available in -3 speed
- System featured FPGAs
  - SelectRAM™ memory: on-chip ultra-fast RAM with
    · synchronous write option
    · dual-port RAM option
  - Abundant flip-flops
  - Flexible function generators
  - Dedicated high-speed carry logic
  - Wide edge decoders on each edge
  - Hierarchy of interconnect lines
  - Internal 3-state bus capability
  - Eight global low-skew clock or signal distribution networks
- System performance beyond 60 MHz
- Flexible array architecture
- Low power segmented routing architecture

- Systems-oriented features
  - IEEE 1149.1-compatible boundary scan logic support
  - Individually programmable output slew rate
  - Programmable input pull-up or pull-down resistors
  - 12 mA sink current per output
- Configured by loading binary file
  - Unlimited reprogrammability
- Readback capability
  - Program verification
  - Internal node observability
- Development system runs on most common computer platforms
  - Interfaces to popular design environments
  - Fully automatic mapping, placement and routing
  - Interactive design editor for design optimization
- Highest capacity: over 130,000 usable gates
- Buffered interconnect for maximum speed
- New latch capability in configurable logic blocks
- Improved VersaRing™ I/O interconnect for better fixed pinout flexibility
  - Virtually unlimited number of clock signals
- Optional multiplexer or 2-input function generator on device outputs
- 5V tolerant I/Os
- Advanced 0.35µ process
- Processed on Xilinx QML line

Definition of Terms

In the following tables, some specifications may be designated as Advance or Preliminary. These terms are defined as follows:

Advance: Initial estimates based on simulation and/or extrapolation from other speed grades, devices, or devicefamilies. Values are subject to change. Use as estimates, not for production.

Preliminary: Based on preliminary characterization. Further changes are not expected.

Unmarked: Specifications not identified as either Advance or Preliminary are to be considered Final.

Except for pin-to-pin input and output parameters, the AC parameter delay specifications included in this document are derived from measuring internal test patterns. All specifications are representative of worst-case supply voltage and junction temperature conditions.

All specifications subject to change without notice.

Additional Specifications

Except for pin-to-pin input and output parameters, the a.c. parameter delay specifications included in this document are derived from measuring internal test patterns. All specifications are representative of worst-case supply voltage and junction temperature conditions. The parameters included are common to popular designs and typical applications. For design considerations requiring more detailed timing information, see the appropriate family AC supplements available on the Xilinx web site at:

http://www.xilinx.com/partinfo/databook.htm.

Absolute Maximum Ratings[1]

Symbol	Description		Units
V_{CC}	Supply voltage relative to GND	−0.5 to 4.0	V
V_{IN}	Input voltage relative to GND[2]	−0.5 to 5.5	V
V_{TS}	Voltage applied to High-Z output[2]	−0.5 to 5.5	V
V_{CCt}	Longest supply voltage rise time from 1V to 3V	50	ms
T_{STG}	Storage temperature (ambient)	−65 to +150	°C
T_{SOL}	Maximum soldering temperature (10s @ 1/16 in. = 1.5 mm)	+260	°C
T_J	Junction temperature	+150	°C

Notes:
1. Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time may affect device reliability.
2. Maximum DC overshoot or undershoot above V_{CC} or below GND must be limited to either 0.5V or 10 mA, whichever is easier to achieve. During transitions, the device pins may undershoot to −2.0 V or overshoot to V_{CC} + 2.0V, provided this over- or undershoot lasts less than 10 ns and with the forcing current being limited to 200 mA.

Recommended Operating Conditions[1]

Symbol	Description	Min	Max	Units
V_{CC}	Supply voltage relative to GND, T_C = −55°C to +125°C	3.0	3.6	V
V_{IH}	High-level input voltage[2]	50% of V_{CC}	5.5	V
V_{IL}	Low-level input voltage	0	30% of V_{CC}	V
T_{IN}	Input signal transition time	-	250	ns

Notes:
1. At junction temperatures above those listed as Operating Conditions, all delay parameters increase by 0.35% per °C.
2. Input and output measurement threshold is ~50% of V_{CC}.

XQR4000XL DC Characteristics Over Recommended Operating Conditions

Symbol	Description	Min	Max	Units
V_{OH}	High-level output voltage at I_{OH} = −4 mA, V_{CC} min (LVTTL)	2.4	-	V
	High-level output voltage at I_{OH} = −500 µA, (LVCMOS)	90% V_{CC}	-	V
V_{OL}	Low-level output voltage at I_{OL} = 12 mA, V_{CC} min (LVTTL)[1]	-	0.4	V
	Low-level output voltage at I_{OL} = 1500 µA, (LVCMOS)	-	10% V_{CC}	V
V_{DR}	Data retention supply voltage (below which configuration data may be lost)	2.5	-	V
I_{CCO}	Quiescent FPGA supply current[2]	-	5	mA
I_L	Input or output leakage current	−10	+10	µA
C_{IN}	Input capacitance (sample tested)	-	10	pF
I_{RPU}	Pad pull-up (when selected) at V_{IN} = 0V (sample tested)	0.02	0.25	mA
I_{RPD}	Pad pull-down (when selected) at V_{IN} = 3.6V (sample tested)	0.02	0.15	mA
I_{RLL}	Horizontal longline pull-up (when selected) at logic Low	0.3	2.0	mA

Notes:
1. With up to 64 pins simultaneously sinking 12 mA.
2. With no output current loads, no active input or Longline pull-up resistors, all I/O pins in a High-Z state and floating.

Power-On Power Supply Requirements

Xilinx FPGAs require a minimum rated power supply current capacity to insure proper initialization, and the power supply ramp-up time does affect the current required. A fast ramp-up time requires more current than a slow ramp-up time. The slowest ramp-up time is 50 ms. Current capacity is not specified for a ramp-up time faster than 2 ms. The current capacity varies linealy with ramp-up time, *e.g.*, an XQR4036XL with a ramp-up time of 25 ms would require a capacity predicted by the point on the straight line drawn from 1A at 120 µs to 500 mA at 50 ms at the 25 ms time mark. This point is approximately 750 mA .

Product	Description	Ramp-up Time	
		Fast (120 µs)	Slow (50 ms)
XQR4013 - 36XL	Minimum required current supply	1A	500 mA
XC4062XL	Minimum required current supply	2A	500 mA

Notes:
1. Devices are guaranteed to initialize properly with the minimum current listed above. A larger capacity power supply may result in a larger initialization current.
2. This specification applies to Commercial and Industrial grade products only.
3. Ramp-up Time is measured from $0V_{DC}$ to $3.6V_{DC}$. Peak current required lasts less than 3 ms, and occurs near the internal power on reset threshold voltage. After initialization and before configuration, I_{CC} max is less than 10 mA.

XQR4000XL AC Switching Characteristic

Testing of the switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.

When fewer vertical clock lines are connected, the clock distribution is faster; when multiple clock lines per column are driven from the same global clock, the delay is longer. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature)

Notes:
1. Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
2. Clock-to-out minimum delay is measured with the fastest route and the lightest load, Clock-to-out maximum delay is measured using the farthest distance and a reference load of one clock pin (IK or OK) per IOB as well as driving all accessible CLB flip-flops. For designs with a smaller number of clock loads, the pad-to-IOB clock pin delay as determined by the static timing analyzer (TRCE) can be added to the AC parameter Tokpof and used as a worst-case pin-to-pin clock-to-out delay for clocked outputs for FAST mode configurations.
3. Output timing is measured at ~50% V_{CC} threshold with 50 pF external capacitive load.
4. OFF = Output Flip-Flop

2. Output timing is measured at ~50% V_{CC} threshold with 50 pF external capacitive load.

Capacitive Load Factor

Figure 1 shows the relationship between I/O output delay and load capacitance. It allows a user to adjust the specified output delay if the load capacitance is different than 50 pF. For example, if the actual load capacitance is 120 pF, add 2.5 ns to the specified delay. If the load capacitance is 20 pF, subtract 0.8 ns from the specified output delay.

Figure 1 is usable over the specified operating conditions of voltage and temperature and is independent of the output slew rate control.

Notes:
1. The XQR4013XL, XQR4036XL, and XQR4062XL have significantly faster partial and full delay setup times than other devices.
2. Input setup time is measured with the fastest route and the lightest load. Input hold time is measured using the furthest distance and a reference load of one clock pin per IOB as well as driving all accessible CLB flip-flops. For designs with a smaller number of clock loads, the pad-to-IOB clock pin delay as determined by the static timing analyzer (TRCE) can be used as a worst-case pin-to-pin no-delay input hold specification.

		XQR4036XL	13.8 / 0.0
		XQR4062XL	13.1 / 0.0

Notes:
1. The XQR4013XL, XQR4036XL, and XQR4062XL have significantly faster partial and full delay setup times than other devices.
2. Input setup time is measured with the fastest route and the lightest load. Input hold time is measured using the furthest distance and a reference load of one clock pin per IOB as well as driving all accessible CLB flip-flops. For designs with a smaller number of clock loads, the pad-to-IOB clock pin delay as determined by the static timing analyzer (TRCE) can be used as a worst-case pin-to-pin no-delay input hold specification.
3. IFF = Input Flip-Flop or Latch
4. FCL = Fast Capture Latch

XQR4000XL IOB Input Switching Characteristic Guidelines

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values. For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature).

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values. ment System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature). For Propagation Delays, slew-rate = fast unless otherwise noted. Values are expressed in nanoseconds unless otherwise noted.
