
6A High-Speed Power MOSFET Drivers

Features

- High Peak Output Current: 6.0A (typical)
- Low Shoot-Through/Cross-Conduction Current in Output Stage
- Wide Input Supply Voltage Operating Range:
 - 4.5V to 18V
- High Capacitive Load Drive Capability:
 - 2500 pF in 20 ns
 - 6800 pF in 40 ns
- Short Delay Times: 40 ns (typical)
- Matched Rise/Fall Times
- Low Supply Current:
 - With Logic '1' Input – 130 μ A (typical)
 - With Logic '0' Input – 35 μ A (typical)
- Latch-Up Protected: Will Withstand 1.5A Reverse Current
- Logic Input Will Withstand Negative Swing up to 5V
- Pin compatible with the TC4420/TC4429 devices
- Space-saving 8-Pin SOIC, PDIP and 8-Pin 6 x 5 mm DFN Packages

Applications

- Switch Mode Power Supplies
- Pulse Transformer Drive
- Line Drivers
- Motor and Solenoid Drive

General Description

The MCP1406/07 devices are a family of buffers/MOSFET drivers that feature a single-output with 6A peak drive current capability, low shoot-through current, matched rise/fall times and propagation delay times. These devices are pin-compatible and are improved versions of the TC4420/TC4429 MOSFET drivers.

The MCP1406/07 MOSFET drivers can easily charge and discharge 2500 pF gate capacitance in under 20 ns, provide low enough impedances (in both the ON and OFF states) to ensure that intended state of the MOSFETs will not be affected, even by large transients. The input to the MCP1406/07 may be driven directly from either TTL or CMOS (3V to 18V).

These devices are highly latch-up resistant under any conditions that fall within their power and voltage ratings. They are not subject to damage when up to 5V of noise spiking (of either polarity) occurs on the ground pin. All terminals are fully protected against electrostatic discharge (ESD), up to 2.0 kV (HBM) and 400V (MM).

The MCP1406/07 single-output 6A MOSFET driver family is offered in both surface-mount and pin-through-hole packages with a -40°C to +125°C temperature rating, making it useful in any wide temperature range application.

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

—	9	—	EP	Exposed Metal Pad
TAB	—	—	V _{DD}	Metal Tab at V _{DD} Potential

Note 1: Duplicate pins must be connected for proper operation.

3.1 Supply Input (V_{DD})

V_{DD} is the bias supply input for the MOSFET driver and has a voltage range of 4.5V to 18V. This input must be decoupled to ground with local capacitors. The bypass capacitors provide a localized low-impedance path for the peak currents that are to be provided to the load.

3.2 Control Input (INPUT)

The MOSFET driver input is a high-impedance, TTL/CMOS-compatible input. The input also has hysteresis between the high and low input levels, allowing them to be driven from slow rising and falling signals, and to provide noise immunity.

3.3 Ground (GND)

Ground is the device return pin. The ground pin should have a low impedance connection to the bias supply source return. High peak currents will flow out the ground pin when the capacitive load is being discharged.

3.4 CMOS Push-Pull Output (OUTPUT)

The output is a CMOS push-pull output that is capable of sourcing peak currents of 6A (V_{DD} = 18V). The low output impedance ensures the gate of the external MOSFET will stay in the intended state even during large transients. The output pins also have reverse current latch-up ratings of 1.5A.

3.5 Exposed Metal Pad (6x5 DFN only)

The exposed metal pad of the DFN package is not internally connected to any potential. Therefore, this pad can be connected to a ground plane or other copper plane on a printed circuit board to aid in heat removal from the package.

3.6 TO-220 Metal Tab

The metal tab on the TO-220 package is at V_{DD} potential. This metal tab is not intended to be the V_{DD} connection to MCP1406/07. V_{DD} should be supplied using the Supply Input pin of the TO-220.

MCP1406/07

4.0 APPLICATION INFORMATION

4.1 General Information

MOSFET drivers are high-speed, high current devices which are intended to provide high peak currents to charge the gate capacitance of external MOSFETs or IGBTs. In high frequency switching power supplies, the PWM controller may not have the drive capability to directly drive the power MOSFET. A MOSFET driver like the MCP1406/07 family can be used to provide additional drive current capability.

4.2 MOSFET Driver Timing

The ability of a MOSFET driver to transition from a fully-OFF state to a fully-ON state are characterized by the drivers' rise time (t_R), fall time (t_F) and propagation delays (t_{D1} and t_{D2}). The MCP1406/07 family of devices is able to make this transition very quickly. Figure 4-1 and Figure 4-2 show the test circuits and timing waveforms used to verify the MCP1406/07 timing.

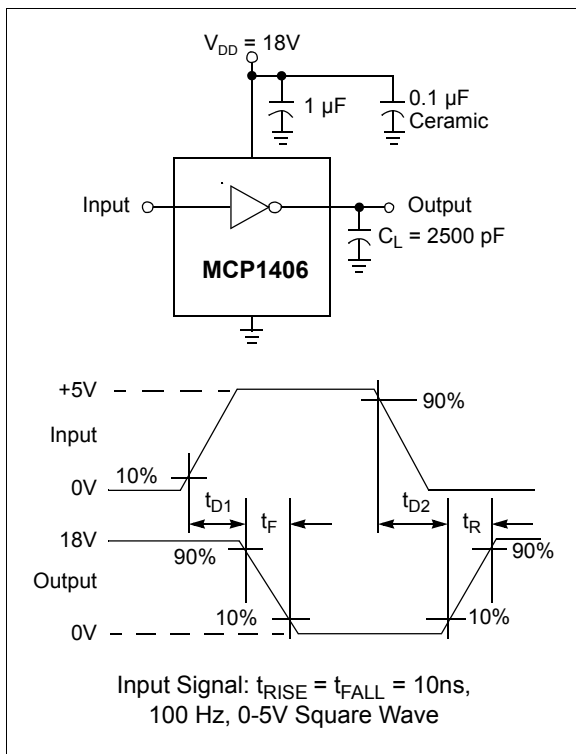

FIGURE 4-1: Inverting Driver Timing Waveform.

FIGURE 4-2: Non-Inverting Driver Timing Waveform.

4.3 Decoupling Capacitors

Careful layout and decoupling capacitors are highly recommended when using MOSFET drivers. Large currents are required to charge and discharge capacitive loads quickly. For example, 2.25A are needed to charge a 2500 pF load with 18V in 20 ns.

To operate the MOSFET driver over a wide frequency range with low supply impedance, a ceramic and a low ESR film capacitor are recommended to be placed in parallel between the driver V_{DD} and the GND. A 1.0 μF low ESR film capacitor and a 0.1 μF ceramic capacitor placed between pins 1, 8 and 4, 5 should be used. These capacitors should be placed close to the driver to minimize circuit board parasitics and provide a local source for the required current.

4.4 PCB Layout Considerations

Proper PCB layout is important in a high current, fast switching circuit to provide proper device operation and robustness of design. PCB trace loop area and inductance should be minimized by the use of a ground plane or ground trace located under the MOSFET gate drive signals, separate analog and power grounds, and local driver decoupling.

The MCP1406/07 devices have two pins each for V_{DD} , OUTPUT and GND. Both pins must be used for proper operation. This also lowers path inductance which will, along with proper decoupling, help minimize ringing in the circuit.

Placing a ground plane beneath the MCP1406/07 will help as a radiated noise shield as well as providing some heat sinking for power dissipated within the device.

4.5 Power Dissipation

The total internal power dissipation in a MOSFET driver is the summation of three separate power dissipation elements, which can be calculated by using the following equation:

EQUATION 4-1:

$$P_T = P_L + P_Q + P_{CC}$$

Where:

- P_T = Total power dissipation
- P_L = Load power dissipation
- P_Q = Quiescent power dissipation
- P_{CC} = Operating power dissipation

4.5.1 CAPACITIVE LOAD DISSIPATION

The power dissipation caused by a capacitive load is a direct function of frequency, total capacitive load and supply voltage. The power lost in the MOSFET driver for a complete charging and discharging cycle of a MOSFET can be determined by means of this equation:

EQUATION 4-2:

$$P_L = f \times C_T \times V_{DD}^2$$

Where:

- f = Switching frequency
- C_T = Total load capacitance
- V_{DD} = MOSFET driver supply voltage

4.5.2 QUIESCENT POWER DISSIPATION

The power dissipation associated with the quiescent current draw depends on the state of the input pin. The MCP1406/07 devices have a quiescent current draw when the input is high of 0.13 mA (typ) and 0.035 mA (typ) when the input is low. The quiescent power dissipation can be determined by using this equation:

EQUATION 4-3:

$$P_Q = (I_{QH} \times D + I_{QL} \times (1 - D)) \times V_{DD}$$

Where:

- I_{QH} = Quiescent current in the high state
- D = Duty cycle
- I_{QL} = Quiescent current in the low state
- V_{DD} = MOSFET driver supply voltage

4.5.3 OPERATING POWER DISSIPATION

The operating power dissipation occurs each time the MOSFET driver output transitions; this is because, for a very short period of time, both MOSFETs in the output stage are ON simultaneously. This cross-conduction current leads to a power dissipation, as described by the following equation:

EQUATION 4-4:

$$P_{CC} = CC \times f \times V_{DD}$$

Where:

- CC = Cross-conduction constant (A sec.)
- f = Switching frequency
- V_{DD} = MOSFET driver supply voltage

RECOMMENDED LAND PATTERN

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Contact Pitch	E	1.27 BSC		
Contact Pad Spacing	C		5.40	
Contact Pad Width (X8)	X1			0.60
Contact Pad Length (X8)	Y1			1.55

Notes:

1. Dimensioning and tolerancing per ASME Y14.5M

NOTES:

APPENDIX A: REVISION HISTORY

Revision C (April 2016)

The following is the list of modifications:

- Updated the Package Thermal Resistances section of [Temperature Characteristics](#) table with the latest information.
- Updated [Figure 2-21](#) in [Section 2.0 “Typical Performance Curves”](#).

Revision B (May 2012)

The following is the list of modifications:

Removed the information referring to the Electrostatic Discharge from the [General Description](#) section.

Revision A (December 2006)

Original release of this document.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
