

SMT POWER INDUCTORS

Shielded Drum Core - PL89XX Series

-  **Height:** 7.1mm Max
-  **Footprint:** 10.5mm x 10.5mm Max
-  **Inductance Range:** 0.8μH to 54.4μH
-  **Current Rating:** up to 11A

Electrical Specifications @ 25°C — Operating Temperature -55°C to +130°C

SMT POWER INDUCTORS

Shielded Drum Core - PL89XX Series

Notes from Tables

1. Temperature of the component (ambient plus temperature rise) must be within specified operating temperature range.
2. The rated current as listed is either the saturation current or the heating current depending on which value is lower.
3. The saturation current is the current which causes the inductance to drop to 75% of its initial inductance at zero bias. This current is determined by placing the component at room ambient (25°C), and applying a short duration pulse current (to eliminate self-heating effects) to the component.
4. The heating current is the DC current, which causes the temperature of the part to increase by approximately 40°C. This current is determined by extending the terminals of the component with 30mm length 28 gauge buss wires and applying the current to the device for 30 minutes. The temperature is measured by placing the thermocouple between the winding and the shield.
5. In high volt*time applications, additional heating in the component can occur due to core losses in the inductor which may necessitate derating the current in order to limit the temperature rise of the component. In order to determine the approximate total loss (or temperature rise) for a given application, both copper losses and core losses should be taken into account.
