PHOTON IS OUR BUSINESS

PHOTOMULTIPLIER TUBE R13456

FEATURES

High sensitivity

•Biomedical analysis

- Blood analyzer, Flow cytometer, DNA sequencer •Environmental monitoring
- NOx analyzer

Spectroscopy

Fluorescence spectrometer, Raman spectrometer, UV–VIS-NIR spectrometer

Microscopy

NOTES

A: Averaged over any interval of 30 s maximum.

- B: The light source is a tungsten filament lamp operated at a distribution temperature of 2856 K. Supply voltage is 100 V between the cathode and all other electrodes connected together as anode.
- C:Red/White ratio is the quotient of the cathode current measured using a red filter(Toshiba R-68) interposed between the light source and the tube by the cathode current measured with the filter removed under the same conditions as Note B.
- D: The value is cathode output current when a blue filter (Corning CS 5-58 polished to 1/2 stock thickness) is interposed between the light source and the tube under the same condition as Note B.
- E: Measured with the voltage distribution ratio shown in Table 1 below.

Table 1:Voltage distribution ratio

	Electrode	ł	<	Dy	y1 Dy		/2 Dy3		3	Dy4		Dy5		Dye	5 D	Dy7		y8	Dy9			Р
	Distribution ratio		1		-	1		1 1		1	1		-	1	1		1		1	1		
Supply voltage: 1000 V, K: Cathode, Dy: Dynode, P: Anod											de											

F: Measured with the same supply voltage and voltage distribution ratio as Note E after removal of light.

G: ENI is an indication of the photon-limited signal-to-noise ratio. It refers to the amount of light in watts to produce a signal-to-noise ratio of unity in the output of a photomultiplier tube.

$$\mathsf{ENI} = \frac{\sqrt{2q} \cdot \mathsf{Idb} \cdot \mathbf{G} \cdot \Delta \mathbf{f}}{\mathsf{S}}$$

where $q = Electronic charge (1.60 \times 10^{-19} coulomb).$

- ldb = Anode dark current(after 30 min storage) in amperes. G = Gain.
 - Δf = Bandwidth of the system in hertz. 1 Hz is used.
 - S = Anode radiant sensitivity in amperes per watt at the wavelength of peak response.
- H: The rise time is the time for the output pulse to rise from 10 % to 90 % of the peak amplitude when the entire photocathode is illuminated by a delta function light pulse.
- I: The electron transit time is the interval between the arrival of delta function light pulse at the entrance window of the tube and the time when the anode output reaches the peak amplitude. In measurement, the whole photo-cathode is illuminated.
- J: Also called transit time jitter. This is the fluctuation in electron transit time between individual pulses in the signal photoelectron mode, and may be defined as the FWHM of the frequency distribution of electron transit times.
