description

The TMS464409 and TMS465409 series are low-voltage, 67 108 864-bit dynamic random-access memories (DRAMs), organized as 16 777 216 words of 4 bits each. The TMS464409P and TMS465409P series are high-speed, low-voltage, low-power, self-refresh, 67 108 864-bit DRAMs, organized as 16 777 216 words of 4 bits each. Both sets of devices employ state-of-the-art technology for high performance, reliability, and low power.

These devices feature maximum $\overline{\text{RAS}}$ access times of 40, 50, and 60 ns. All inputs and outputs, including clocks, are compatible with LVTTTL. All addresses and data-in lines are latched on chip to simplify system design. Data out is unlatched to allow greater system flexibility.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCT PREVIEW information concerns products in the formative or design phase of development. Characteristic data and other specifications are design goals. Texas Instruments reserves the right to change or discontinue these products without notice.

description (continued)

The TMS46x409 and TMS46x409P series are offered in a 400-mil, 32-lead plastic surface mount TSOP package (DGC suffix). This package is designed for operation from 0°C to 70°C.

operation

extended data out

Extended data out (EDO) allows data output rates up to 66 MHz for 40-ns devices. When keeping the same row address while selecting random column addresses, the time for row-address setup and hold and for address multiplex is eliminated. The maximum number of columns that can be accessed is determined by t_{RAS} , the maximum RAS low time.

Extended data out does not place the data in/data out pins (DQ pins) into the high-impedance state with the rising edge of \overline{CAS} during \overline{RAS} low. The output remains valid for the system to latch the data. After \overline{CAS} goes high, the DRAM decodes the next address. \overline{OE} and \overline{W} can control the output impedance. Descriptions of \overline{OE} and \overline{W} further explain EDO operation benefit.

address: A0–A11 (TMS465409/P) and A0–A12 (TMS464409/P)

Twenty-four address bits are required to decode each one of 16 777 216 storage cell locations. For the TMS465409 and TMS465409P, 12 row-address bits are set up on A0 through A11 and latched onto the chip by the row-address strobe (\overline{RAS}). Twelve column-address bits are set up on A0 through A11. For the TMS464409 and TMS464409P, 13 row-address bits are set up on inputs A0 through A12 and latched onto the chip by \overline{RAS} . Eleven column-address bits are set up on A0 through A10. All addresses must be stable on or before the falling edge of \overline{RAS} and \overline{CAS} . \overline{RAS} is similar to a chip enable because it activates the sense amplifiers as well as the row decoder. \overline{CAS} is used as a chip select, activating the output buffers and latching the address bits into the column-address buffers.

output enable (\overline{OE})

\overline{OE} controls the impedance of the output buffers. While \overline{CAS} and \overline{RAS} are low and \overline{W} is high, \overline{OE} can be brought low or high and the DQs transition between valid data and high impedance (see Figure 8). There are two methods for placing the DQs into the high-impedance state and maintaining that state during \overline{CAS} high time. The first method is to transition \overline{OE} high before \overline{CAS} transitions high and keep \overline{OE} high for t_{CHO} (hold time, \overline{OE} from \overline{CAS}) past the \overline{CAS} transition. This disables the DQs and they remain disabled, regardless of \overline{OE} , until \overline{CAS} falls again. The second method is to have \overline{OE} low as \overline{CAS} transitions high. Then \overline{OE} can pulse high for a minimum of t_{OEP} (precharge time, \overline{OE}) anytime during \overline{CAS} high time, disabling the DQs regardless of further transitions on \overline{OE} until \overline{CAS} falls again (see Figure 8).

write enable (\overline{W})

The read or write mode is selected through \overline{W} . A logic high on \overline{W} selects the read mode, and a logic low selects the write mode. The data inputs are disabled when the read mode is selected. When \overline{W} goes low prior to \overline{CAS} (early write), data out remains in the high-impedance state for the entire cycle, permitting a write operation with \overline{OE} grounded. If \overline{W} goes low in an extended-data-out read cycle, the DQs are disabled so long as \overline{CAS} is high (see Figure 9).

data in/data out (DQ1–DQ4)

Data is written during a write or read-modify-write cycle. Depending on the mode of operation, the later falling edge of \overline{CAS} or \overline{W} strobes data into the on-chip data latch with setup and hold times referenced to the later edge. The DQs drive valid data after all access times are met and remain valid except in cases described in the \overline{W} and \overline{OE} descriptions.

\overline{RAS} -only refresh

A refresh operation must be performed at least once every 64 ms (128 ms for TMS46x409P) to retain data by strobing each of the 4096 rows for TMS465409/P or 8192 rows for TMS464409/P. A normal read or write cycle refreshes all bits in each row that is selected. A \overline{RAS} -only operation can be used by holding \overline{CAS} at the high (inactive) level, conserving power as the output buffers remain in the high-impedance state. Externally generated addresses must be used for a \overline{RAS} -only refresh.

16 777 216 BY 4-BIT EXTENDED DATA OUT

DYNAMIC RANDOM-ACCESS MEMORIES

SMKS895A – MAY 1997 – REVISED OCTOBER 1997

hidden refresh

A hidden refresh can be performed while maintaining valid data at the output pin. This is accomplished by holding $\overline{\text{CAS}}$ at V_{IL} after a read operation and cycling $\overline{\text{RAS}}$ after a specified precharge period, similar to a $\overline{\text{RAS}}$ -only refresh cycle. The external address is ignored, and the refresh address is generated internally.

$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ (CBR) refresh

CBR refresh is performed by bringing $\overline{\text{CAS}}$ low earlier than $\overline{\text{RAS}}$ (see parameter t_{CSR}) and holding it low after $\overline{\text{RAS}}$ falls (see parameter t_{CHR}). For successive CBR refresh cycles, $\overline{\text{CAS}}$ can remain low while cycling $\overline{\text{RAS}}$. The external address is ignored, and the refresh address is generated internally.

battery-backup refresh

A low-power battery-backup refresh mode that requires less than 250 μA of refresh current is available on the TMS464409P and TMS465409P. Data integrity is maintained using CBR refresh with a period of 31.25 μs while holding $\overline{\text{RAS}}$ low for less than 300 ns. To minimize current consumption, all input levels must be at LVCMOS levels ($V_{\text{IL}} < 0.2 \text{ V}$, $V_{\text{IH}} > V_{\text{CC}} - 0.2 \text{ V}$).

self-refresh (TMS46x409P)

The self-refresh mode is entered by dropping $\overline{\text{CAS}}$ low prior to $\overline{\text{RAS}}$ going low. Then $\overline{\text{CAS}}$ and $\overline{\text{RAS}}$ are both held low for a minimum of 100 μs . The chip is then refreshed internally by an on-board oscillator. No external address is required because the CBR counter is used to keep track of the address. To exit the self-refresh mode, both $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are brought high to satisfy t_{CHS} . Upon exiting self-refresh mode, a burst refresh (refreshes a full set of row addresses) must be executed before continuing with normal operation. The burst refresh ensures the DRAM is fully refreshed.

power up

To achieve proper device operation, an initial pause of 200 μs followed by a minimum of eight initialization cycles is required after power up to the full V_{CC} level. These eight initialization cycles must include at least one refresh ($\overline{\text{RAS}}$ -only or CBR) cycle.

test mode

The test mode (see Figure 1) is initiated with a CBR-refresh cycle while simultaneously holding the $\overline{\text{W}}$ input low. The entry cycle performs an internal refresh cycle while internally setting the device to perform parallel read or write on subsequent cycles. While in the test mode, any data sequence can be performed. The device exits test mode if a CBR refresh cycle with $\overline{\text{W}}$ held high or a $\overline{\text{RAS}}$ -only refresh cycle is performed.

In the test mode, the device is configured as 1024K bits \times 4 bits for each DQ. Each DQ pin has a separate 4-bit parallel read and write data bus that ignores column addresses A0 and A1. During a read cycle, the four internal bits are compared for each DQ pin. If the four bits agree, DQ goes high; if not, DQ goes low. During a write cycle, the data states of all four DQs must be the same to ensure proper function of the test mode. Test time is reduced by a factor of four for this series.

test mode (continued)

NOTE A: The states of $\overline{\text{W}}$, data in, and address are defined by the type of cycle used during test mode.

t _{WCS}	Setup time, write command before $\overline{\text{CAS}}$ active (early-write only)	0		0		0		ns
t _{WRP}	Setup time, $\overline{\text{W}}$ high before $\overline{\text{RAS}}$ low (CBR refresh only)	5		5		5		ns
t _{WTS}	Setup time, $\overline{\text{W}}$ low before $\overline{\text{RAS}}$ low (test mode only)	5		5		5		ns
t _{CSR}	Setup time, $\overline{\text{CAS}}$ referenced to $\overline{\text{RAS}}$ (CBR refresh only)	5		5		5		ns
t _{CAH}	Hold time, column address	6		8		10		ns
t _{DH}	Hold time, data in (see Note 10)	6		8		10		ns
t _{RAH}	Hold time, row address	6		8		10		ns
t _{RCH}	Hold time, read command referenced to $\overline{\text{CAS}}$ (see Note 11)	0		0		0		ns
t _{RRH}	Hold time, read command referenced to $\overline{\text{RAS}}$ (see Note 11)	0		0		0		ns
t _{WCH}	Hold time, write command during $\overline{\text{CAS}}$ active (early-write only)	6		8		10		ns
t _{ROH}	Hold time, $\overline{\text{RAS}}$ referenced to $\overline{\text{OE}}$	6		8		10		ns
t _{WRH}	Hold time, $\overline{\text{W}}$ high after $\overline{\text{RAS}}$ low (CBR refresh)	6		8		10		ns
t _{WTH}	Hold time, $\overline{\text{W}}$ low after $\overline{\text{RAS}}$ low (test mode only)	6		8		10		ns
t _{CHR}	Hold time, $\overline{\text{CAS}}$ referenced to $\overline{\text{RAS}}$ (CBR refresh only)	6		8		10		ns
t _{OEH}	Hold time, $\overline{\text{OE}}$ command	11		13		15		ns
t _{CHS}	Hold time, $\overline{\text{CAS}}$ active after $\overline{\text{RAS}}$ precharge (self-refresh)	-50		-50		-50		ns
t _{RHCP}	Hold time, $\overline{\text{RAS}}$ active from $\overline{\text{CAS}}$ precharge	22		28		35		ns

NOTES: 4. With ac parameters, it is assumed that $t_T = 2$ ns.

8. In a read-write cycle, t_{RWD} and t_{RWL} must be observed.

9. During the period of $10 \mu\text{s} \leq t_{\text{RASS}} \leq 100 \mu\text{s}$, the device is in transition state from normal operation mode to self-refresh mode.

10. Referenced to the later of CAS or W in write operations

11. Either t_{RRH} or t_{RCH} must be satisfied for a read cycle.

timing requirements (see Note 4) (continued)

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
