

# LTC6430 and LTC2158 15dB Differential Amplifier and 14-Bit, 310Msps Dual ADC

## DESCRIPTION

Demonstration circuit 1946A supports the [LTC®6430](#) and the [LTC2158](#) high speed ADC. It was specially designed for applications that include an LTC6430, a high speed amplifier with 15dB of gain.

The circuitry on the analog inputs is optimized for analog input frequencies from 50MHz up to 1GHz. Refer to the

data sheet for proper input networks for different input frequencies

**Design files for this circuit board are available at <http://www.linear.com/demo>**

LT, LT, LTC, LTM, Linear Technology and the Linear logo are registered trademarks and PScope is a trademark of Linear Technology Corporation. All other trademarks are the property of their respective owners.

**Table 1. DC1946A**

DEMONSTRATION CIRCUIT	ADC PART NUMBER	AMPLIFIER PART NUMBER	RESOLUTION	MAXIMUM SAMPLE RATE	INPUT FREQUENCY
1946A	LTC2158-14	LTC6430-15	14-BIT	310Msps	50-1000MHz

**Table 2. Performance Summary (T<sub>A</sub> = 25°C)**

PARAMETER	CONDITION	MIN	TYP	MAX	UNIT
Supply Voltage – ADC (V <sup>+</sup> )	This Supply Must Provide Up to 800mA.	3.0		6	V
Supply Voltage – Amplifier (+5V)	This Supply Must Provide Up to 500mA. This Pin Is Unregulated	4.75	5	5.25	V
Analog Input Range				400	mV <sub>p-p</sub>
Logic Input Voltages	Minimum Logic High	1.2			V
	Maximum Logic Low			0.6	V
Logic Output Voltages (Differential)	Nominal Logic Levels (100Ω Load, 3.5mA Mode, 1.25V Common Mode)		350		mV
	Minimum Logic levels (100Ω Load, 3.5mA Mode, 1.25V Common Mode)		247		mV
Sampling Frequency (Encode Clock Frequency)		10		310	MHz
Encode Clock Level (Single-Ended at J2)	Minimum Logic Levels (ENC <sup>-</sup> Tied to GND)	0			V
	Maximum Logic Level (ENC <sup>-</sup> Tied to GND)			3.6	V
Encode Clock Level (Differential at J2)	Minimum Logic Levels (ENC <sup>-</sup> Not Tied to GND, 1.2V Common Mode)	0.2			V

## QUICK START PROCEDURE

Demonstration circuit 1946A is easy to set up to evaluate the performance of the LTC2158 A/D converter. Refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

### SETUP

The DC1371 USB demonstration circuit was supplied with the DC1946A global demonstration circuit, follow the DC1371 Quick Start Guide to install the required software and for connecting the DC1371 to the DC1946A and to a PC.

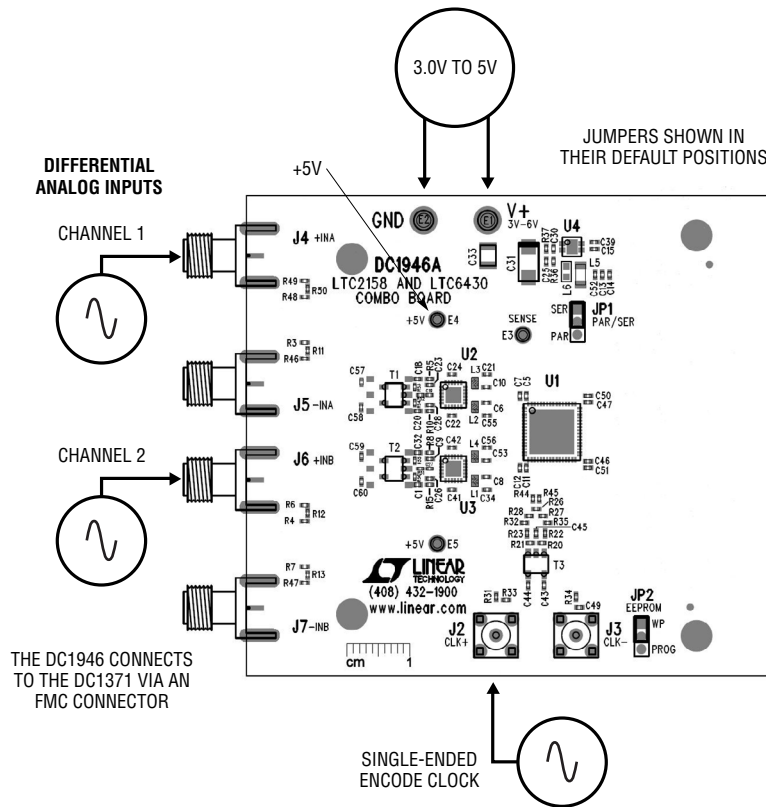

Figure 1. DC1946A Setup (Zoom for Detail)

## QUICK START PROCEDURE

### HARDWARE SETUP

#### SMA

**J4 & J5:** Channel 1 Analog Inputs: As a default the DC1946A is populated to accept a single-ended input. Apply a single-ended signal to J4. For use with a differential signal remove R3 and populate R11 with a  $0\Omega$  resistor. Apply a differential signal to these SMA connectors from a differential driver. These SMAs are positioned 0.8" apart to accommodate LTC differential driver boards.

**J6 & J7:** Channel 2 Analog Inputs. As a default the DC1946A is populated to accept a single-ended input. Apply a single-ended signal to J6. For use with a differential signal remove R7 and populate R13 with a  $0\Omega$  resistor. Apply a differential signal to these SMA connectors from a differential driver. These SMAs are positioned 0.8" apart to accommodate LTC differential driver boards.

**J2 CLK+:** Positive Encode Clock Input. As a default the demo board is populated to accept a single-ended clock input from a low jitter signal generator. For other population options see the encode clock section of this manual.

**J3 CLK-:** Negative Encode Clock Input. As a default this input port is grounded to accommodate the single-ended clock drive. For other population options see the encode clock section of this manual.

#### Turrets

**V+ :** Positive input voltage for the ADC and digital buffers. This voltage feeds a regulator that supplies the proper voltages for the ADC and buffers. The voltage range for this turret is 3.3V to 5V.

**+5V:** Positive input voltage for the LTC6430. Apply a 5V signal to this turret to power the LTC6430. This turret is connected to the amplifier directly and is not regulated. There is a resistor on the back of the board R14 that will connect the power pins of the two amplifiers. By removing this resistor each amplifier can be powered independently.

**SENSE:** Optional Reference Voltage. This pin is connected directly to the SENSE pin of the ADC. Connect SENSE to a 1.25V external reference and the external reference mode is automatically selected. The external reference must be  $1.25V \pm 25mV$  for proper operation. If no external voltage is supplied, this pin will be pulled up to  $V_{DD}$  through a weak pull-up resistor.

**GND:** Ground Connection. This demo board only has a single ground plane. This turret should be tied to the GND terminal of the power supply being used.

#### Jumpers

The DC1946A demonstration circuit should have the following jumper settings as default positions (per Figure 1) which configure the ADC in serial programming mode. In the default configuration JP1-JP2 should be left in the default locations. This will pull PAR/SER low putting the part in serial configuration mode.

**JP1-PAR/SER:** Selects Parallel or Serial Programming Mode (Default: Serial). The DC1946A will not work in parallel programming mode unless a custom FPGA load is used.

**JP2-EEPROM:** EEPROM Write Protect. For factory use only. Should be left in the enable (PROG) position.

### APPLYING POWER AND SIGNALS TO THE DC1946A DEMONSTRATION CIRCUIT

If a DC1371 is used to acquire data from the DC1946A, the DC1371 must FIRST be connected to a powered USB port and provided an external 5V BEFORE applying +3V to +5.0V across the pins marked V+ and GND on the DC1946A. The 5V for the LTC6430 should be applied after the ADC is powered. DC1946A requires 3V for proper operation. Regulators on the board produce the voltages required for the ADC. The power for the LTC6430 is unregulated. The DC1946A demonstration circuit requires up to 800mA on V+ and 500mA on +5V. The DC1946A should not be removed or connected to the DC1371 while power is applied.

## QUICK START PROCEDURE

### ANALOG INPUT NETWORK

The input network of the DC1946A can be modified to accommodate various applications. In the default setup J4 and J6 are used as single-ended inputs. Onboard transformers are used to do a single-ended-to-differential translation to drive the LTC6430 differentially. If differential drive is desired both of the inputs are brought out to SMA connectors so the demo board can be driven with a differential source. To drive the demo board with a differential source simply remove R3 and R7 and populate R11 and R13 with  $0\Omega$  resistors. Then remove T1 and T2 and jump over the pads with  $0\Omega$  resistors. This will allow the board to be driven differentially from a differential source. The inputs SMA connectors for the input signals are 0.8" apart to accommodate LTC differential driver boards.

In almost all cases, off board filters will be required on the analog input of the differential driver to produce data sheet SNR.

The off board filters should be located close to the inputs of the differential driver to avoid reflections from impedance discontinuities at the driven end of a long transmission line. Most filters do not present  $50\Omega$  outside the passband. In some cases, 3dB to 10dB pads may be required to obtain low distortion.

Apply the analog input signal of interest to the SMA connectors on the DC1946A marked J4 and J6.

### ENCODE CLOCK

Apply an encode clock to the SMA connector on the DC1946A demonstration circuit board marked J2. As a default the DC1946A is populated to have a single-ended clock input. It is possible to modify the demo board.

For the best noise performance, the encode input must be driven with a very low jitter signal source. The amplitude should be as large as possible up to  $2V_{P-P}$  or 10dBm.

Using bandpass filters on the clock and the analog input will improve the noise performance by reducing the wideband noise power of the signals. In the case of the DC1946A, a bandpass filter used for the clock should be used prior to the DC1075A. Data sheet FFT plots are taken with 10-pole LC filters made by TTE (Los Angeles, CA) to suppress signal

generator harmonics, nonharmonically related spurs and broadband noise. Low phase noise Agilent 8644B generators are used with TTE bandpass filters for both the clock input and the analog input.

When using a PECL or LVDS clock you can drive the DC1946A differentially through J2 and J3. From the default population, remove the resistors in the R33, R22 and R23 positions and populate  $0\Omega$  resistors in the R31, R32, R34, and R35 positions. Add the appropriate termination for your clock signal. R27, R28, R29, R30 and R26 are available to provide the proper termination for LVDS, PECL, or CML signaling. Blocking capacitors can be installed in the R44 and R45 positions if the common mode voltage of the clock is not compatible with the LTC2158.

### SOFTWARE

The DC1371 is controlled by the PScope™ system software provided or downloaded from the Linear Technology website at <http://www.linear.com/software/>. If a DC1371 was provided, follow the DC1371 Quick Start Guide and the instructions below.

To start the data collection software if “PScope.exe”, is installed (by default) in \Program Files\LTC\PScope\, double click the PScope icon or bring up the run window under the start menu and browse to the PScope directory and select PScope.

If the DC1946A demonstration circuit is properly connected to the DC1371, PScope should automatically detect the DC1946A, and configure itself accordingly. If necessary the procedure below explains how to manually configure PScope.

Under the “Configure” menu, go to “ADC Configuration....” Check the “Config Manually” box and use the following configuration options, see Figure 2:

Manual Configuration settings:

Bits: 14

Alignment: 16

FPGA Ld: S2157

Channs: 2

## QUICK START PROCEDURE

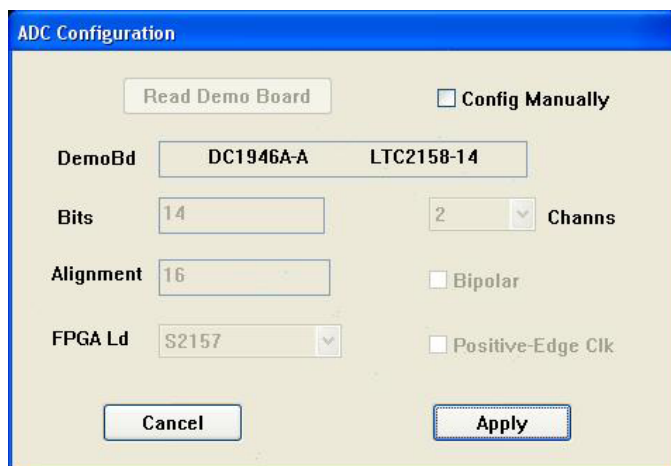

Figure 2: ADC Configuration

Bipolar: Unchecked

Positive-Edge Clk: Unchecked

If everything is hooked up properly, powered and a suitable encode clock is present, clicking the “Collect” button should result in time and frequency plots displayed in the PScope window. Additional information and help for PScope is available in the DC1371 Quick Start Guide and in the online help available within the PScope program itself.

### SERIAL PROGRAMMING

PScope has the ability to program the DC1946A board serially through the DC1371. There are several options available for the LTC2158 that are only available through serially programming. PScope allows all of these features to be tested.

These options are available by first clicking on the “Set Demo Bd Options” icon on the PScope toolbar (Figure 3).

Figure 3: PScope Toolbar

This will bring up the menu shown in Figure 4.

This menu allows any of the options available for the LTC2158 to be programmed serially. The LTC2158 family has the following options:

Figure 4: Demobd Configuration Options

**Sleep Mode** – Selects between normal operation, sleep modes:

Off (Default): ADC is powered and active

On: ADC is powered down

**Nap Mode** – ADC core powers down while references stay active:

Off (Default): ADC is powered and active

On: ADC is put into nap mode

**Power Down B** – Powers down channel 2 while references stay active:

Off (Default): ADC is powered and active

On: Channel 2 of ADC is powered down

## QUICK START PROCEDURE

**Clock Invert** – Selects the polarity of the CLKOUT signal:

Disable (Default): Normal CLKOUT polarity

Enable: CLKOUT polarity is inverted

**Clock Delay** – Selects the phase delay of the CLKOUT signal:

None (Default): No CLKOUT delay

45 deg: CLKOUT delayed by 45 degrees

90 deg: CLKOUT delayed by 90 degrees

135 deg: CLKOUT delayed by 135 degrees

**Clock Duty Cycle** – Enables or disables duty cycle stabilizer:

Stabilizer off (Default): Duty cycle stabilizer disabled

Stabilizer on: Duty cycle stabilizer enabled

**Output Current** – Selects the LVDS output drive current:

1.75mA (Default): LVDS output driver current

2.1mA: LVDS output driver current

2.5mA: LVDS output driver current

3.0mA: LVDS output driver current

3.5mA: LVDS output driver current

4.0mA: LVDS output driver current

4.5mA: LVDS output driver current

**Internal Termination** – Enables LVDS internal termination:

Off (Default): Disables internal termination

On: Enables internal termination

**Outputs** – Enables digital outputs:

Enabled (Default): Enables digital outputs

Disabled: Disables digital outputs

**Test Pattern** – Selects Digital output test patterns:

Off (Default): ADC data presented at output

All out = 1: All digital outputs are 1

All out = 0: All digital outputs are 0

Checkerboard: 0F and D13-D0 Alternate between 1 01 0101 1010 0101 and 0 10 1010 0101 1010 on alternating samples.

Alternating: Digital outputs alternate between all 1's and all 0's on alternating samples.

**ABP** – Alternate bit polarity (ABP) mode

Off (Default): Disables alternate bit polarity

On: Enables alternate bit polarity (Before enabling ABP, be sure the part is in offset binary mode)

**TP Enable** – Enables test patterns

Disabled (Default): Disables test patterns, ADC data presented at output

Enabled: Enables the test pattern

**Randomizer** – Enables data output randomizer

Off (Default): Disables data output randomizer

On: Enables data output randomizer

**Two's Complement** – Enables two's complement mode

Off (Default): Selects offset binary mode

On: Selects two's complement mode

Once the desired settings are selected hit OK and PScope will automatically update the register of the device on the DC1946A demo board.

## DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following **AS IS** conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. **THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.**

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. **LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

LTC currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

**Please read the DEMO BOARD manual prior to handling the product.** Persons handling this product must have electronics training and observe good laboratory practice standards. **Common sense is encouraged.**

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
