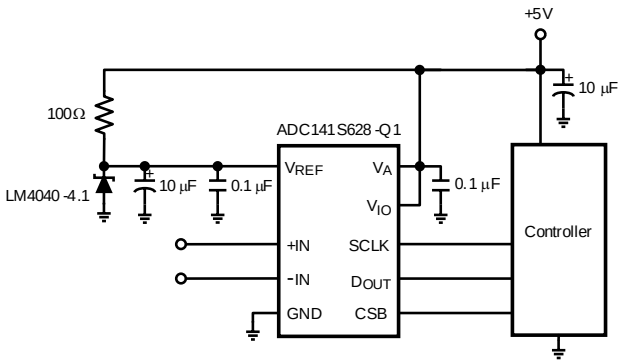
ADC141S628-Q1 14-Bit, 200-kSPS, Pseudo-Differential, Micro-Power ADC

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
  - Device Temperature Grade 2: –40°C to 105°C Ambient Operating Temperature Range
  - Device HBM ESD Classification Level H2
  - Device CDM ESD Classification Level C6
- 14-Bit Resolution With no Missing Codes
- Specified Performance Up to 200 kSPS
- Pseudo Differential Inputs
- Zero-Power Track Mode
- ±150-mV Swing Around GND on Negative Input
- Separate Digital I/O and Analog Supplies
- Operating Temperature Range of –40°C to +105°C
- SPI™, QSPI™, Microwire, DSP-Compatible Serial Interface
- Conversion Rate: 50 kSPS to 200 kSPS
- INL (–15°C to +65°C): ±0.95 LSB (max)
- DNL: ±0.95 LSB (max)
- Post Calibration TUE (–15°C to +65°C): ±0.5 mV (max)
- SNR: 80 dBc (min)
- THD: –97 dBc (typ)
- ENOB: 13.0 Bits (min)
- Power Consumption:
  - 200 kSPS, 5 V: 4.8 mW (typ)
  - Power-Down, 5 V: 13 µW (typ)

Typical Application Diagram



2 Applications

- Automotive Battery Management
- Automotive Navigation
- Portable Systems
- Medical Instruments
- Instrumentation and Control Systems
- Motor Control
- Direct Sensor Interface

3 Description

The ADC141S628-Q1 device is a 14-bit, 200-kSPS, pseudo-differential, analog-to-digital converter (ADC) that is AEC-Q100 grade 2 qualified. The converter is based on a successive-approximation register (SAR) architecture and has pseudo-differential analog inputs. The signal path is maintained from the internal sample-and-hold circuits throughout the ADC to provide excellent common-mode noise rejection. The ADC141S628-Q1 features a zero-power track mode where the ADC is consuming the minimum amount of supply current while the internal sampling capacitor tracks the applied analog input voltage.

The serial data output of the ADC141S628-Q1 is straight binary and is compatible with several standards, such as SPI, QSPI, Microwire, and many common DSP serial interfaces. The ADC141S628-Q1 has no latency which means the conversion result is clocked out by the serial clock input and is the result of the conversion currently in progress.

The ADC141S628-Q1 can be operated with independent analog (VA) and digital input/output (VIO) supplies. VA and VIO can range from 4.5 V to 5.5 V and can be set independent of each other. This functionality allows a user to maximize performance and minimize power consumption. Similarly, the ADC141S628-Q1 uses an external reference that can be varied from 1.0 V to VA allowing users to optimize the full dynamic range of the input. The pseudo-differential input, low power consumption, and small size make the ADC141S628-Q1 ideal for remote data acquisition applications.

Operation is specified over the temperature range of –40°C to +105°C and clock rates of 0.36 MHz to 3.6 MHz. The ADC141S628-Q1 is available in a 10-lead package.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ADC141S628-Q1	VSSOP (10)	3.00 mm × 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (November 2017) to Revision C — **Page**

- Changed first Features bullet, added AEC-Q100 qualification bullet and sub-bullets ... 1
- Changed ADC141S628-Q1 to ADC141S628-Q1 throughout document ... 1
- Changed front page figure ... 1

Changes from Revision A (September 2011) to Revision B — **Page**

- Added *Device Information* table, *Pin Configuration and Functions* section, *ESD Ratings* table, *Thermal Information* table, *Functional Block Diagram* section, *Feature Description* section, *Device Functional Modes* section, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ... 1
- Changed MSOP to VSSOP throughout document ... 1
- Changed *Pin Out Diagram* title from *Connection Diagram* ... 1
- Deleted *Ordering Information* table ... 4
- Added I/O column to *Pin Functions* table ... 4
- Added maximum specification to *Power consumption* row of *Absolute Maximum Ratings* table ... 5
- Changed footnote 1 of *Absolute Maximum Ratings* table ... 5
- Changed *Operating Ratings* table title to *Recommended Operating Conditions* ... 5
- Changed *Operating temperature range* parameter specifications to min and max specifications from $-40 \le T_A \le 105$ max specification ... 5
- Added f_{SCLK} parameter to *Recommended Operating Conditions* from *Operating Conditions* section; deleted *Operating Conditions* section ... 5
- Deleted *Package Thermal Resistance* table ... 5
- Added unit to *Analog input pin, +IN*, *Analog input voltage*, and *Digital input pins voltage range* parameters ... 5
- Deleted footnote 1 from *Recommended Operating Conditions* table and changed last footnote to include updated link ... 5
- Changed condition statement of *ADC141S628-Q1 Converter Electrical Characteristics* table to remove boldface condition ... 6
- Changed *INL* and *PCTUE* parameter specification test conditions ... 6

- Added T_A = *–40°C to +105°C* to I_{DCL} parameter test conditions 6
- Changed V_A to max specification from typ specification in V_{REF} parameter 7
- Changed f_{SCLK} = *0* to f_{SCLK} = *low* in I_{VA} (PD), I_{VIO} (PD), and I_{VREF} (PD) parameter test conditions..... 7
- Deleted last footnote from *ADC141S628-Q1 Converter Electrical Characteristics* table 7
- Changed condition statement of *ADC141S628-Q1 Timing Requirements* table to remove boldface condition 8
- Added temperature conditions to certain parameters in the *ADC141S628-Q1 Timing Requirements* table 8
- Changed title of *Typical Characteristics* from *Typical Performance Characteristics* 10
- Changed *Overview* title from *Functional Description* 14
- Deleted last sentence of second paragraph in *Reference Input (V_{REF})* section 14
- Changed last paragraph of *Reference Input (V_{REF})* section 14
- Changed *Layout Guidelines* title from *PCB Layout and Circuit Considerations*..... 20

5 Pin Configuration and Functions

DGS Package

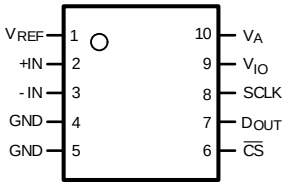
Top View



Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V_{REF}	Reference input	Voltage reference input. A voltage reference between 1 V and V_A must be applied to this input. V_{REF} must be decoupled to GND with a minimum ceramic capacitor value of 0.1 µF. A bulk capacitor value of 1.0 µF to 10 µF in parallel with the 0.1-µF capacitor is recommended for enhanced performance.
2	+IN	Analog signal input, positive	Noninverting input. +IN is the positive analog input for the signal applied to the ADC141S628-Q1.
3	–IN	Analog signal input, negative	Inverting input. Must be GND ± 150 mV.
4	GND	Supply	Ground. GND is the ground reference point for all signals applied to the ADC141S628-Q1.
5	GND	Supply	Ground. GND is the ground reference point for all signals applied to the ADC141S628-Q1.
6	$\overline{CS}$	Digital input	Chip-select bar. $\overline{CS}$ must be active LOW during an SPI conversion, which begins on the falling edge of $\overline{CS}$. The ADC141S628-Q1 is in acquisition mode when $\overline{CS}$ is HIGH.
7	D_{OUT}	Digital output	Serial data output. The conversion result is provided on D_{OUT}. The serial data output word is comprised of two null bits followed by 14 data bits (MSB first). During a conversion, the data are output on the falling edges of SCLK and are valid on the subsequent rising edges.
8	SCLK	Digital input	Serial clock. SCLK is used to control data transfer and serves as the conversion clock.
9	V_{IO}	Supply	Digital input/output power-supply input. A voltage source between 4.5 V and 5.5 V must be applied to this input. V_{IO} must be decoupled to GND with a minimum ceramic capacitor value of 0.1 µF.
10	V_A	Supply	Analog power-supply input. A voltage source between 4.5 V and 5.5 V must be applied to this input. V_A must be decoupled to GND with a minimum ceramic capacitor value of 0.1 µF.

6 Specifications

6.1 Absolute Maximum Ratings

If military/aerospace specified devices are required, please contact the Texas Instruments sales office, distributors for availability and specifications.(1)(2)

	MIN	MAX	UNIT
V_A relative to GND	–0.3	6	V
V_{IO} relative to GND	–0.3	6	V
Voltage between any two pins(3)		6	V
Current in or out of any pin(3)		±10	mA
Package input current(3)		±50	mA
Power consumption at T_A = 25°C		See (4)	
Junction temperature		150	°C
Storage temperature, T_{stg}	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltages are measured with respect to GND = 0 V, unless otherwise specified.
(3) When the input voltage (V_{IN}) at any pin exceeds the power supplies (V_{IN} < GND or V_{IN} > V_A), the current at that pin must be limited to 10 mA and V_{IN} must be within the absolute maximum rating for that pin. The 50-mA maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of 10 mA to five.
(4) The absolute maximum junction temperature ($T_J$max) for this device is 150°C. The maximum allowable power dissipation is dictated by $T_J$max, the junction-to-ambient thermal resistance (θ_{JA}), and the ambient temperature (T_A), and can be calculated using the formula P_DMAX = ($T_J$max – T_A) / θ_{JA}. The values for maximum power dissipation listed above are reached only when the ADC141S628-Q1 is operated in a severe fault condition (for example, when input or output pins are driven beyond the power supply voltages, or the power-supply polarity is reversed). These conditions must be avoided.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002(1)	±4000	V
		Charged-device model (CDM), per AEC Q100-011	±1250	
		Machine model (MM)	±300	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions(1)(1)(2)

	MIN	NOM	MAX	UNIT
Operating temperature range	–40		105	°C
Supply voltage, V_A	4.5		5.5	V
Supply voltage, V_{IO}	4.5		5.5	V
Reference voltage, V_{REF}	1.0		V_A	V
SCLK frequency, f_{SCLK}	0.9		3.6	MHz
Analog input pin, +IN	GND		V_A	V
Analog input pin, –IN			GND ±150 mV	mV
Analog input voltage	GND		V_{REF}	V
Digital input pins voltage range	GND		V_{IO}	V
Clock frequency	50k		3.6M	Hz

(1) All voltages are measured with respect to GND = 0 V, unless otherwise specified.
(2) For soldering specifications, see the *Absolute Maximum Ratings for Soldering* application report.

6.4 ADC141S628-Q1 Converter Electrical Characteristics

The following specifications apply for $V_A = V_{IO} = 5$ V, $V_{REF} = 4.096$ V, and $f_{SCLK} = 0.9$ MHz to 3.6 MHz; $f_{IN} = 20$ kHz and $C_L = 25$ pF, unless otherwise noted. All specifications are at $T_A = 25°C$, unless otherwise noted.(1)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC CONVERTER CHARACTERISTICS						
	Resolution with no missing codes	T_A = –40°C to +105°C			14	Bits
INL	Integral nonlinearity			±0.5		LSB
		T_A = –15°C to +65°C			±0.95	
		T_A = –40°C to +105°C			±1	
DNL	Differential nonlinearity			±0.5		LSB
		T_A = –40°C to +105°C			±0.95	
PCTUE	Post calibration total unadjusted error	–15°C ≤ T_A ≤ 65°C			±0.5	mV
		–40°C ≤ T_A ≤ 105°C	–0.85		1	
OE	Offset error			–1		LSB
		T_A = –40°C to +105°C			±5	
FSE	Full-scale error			–3		LSB
		T_A = –40°C to +105°C			±7	
GE	Gain error			–1.5		LSB
		T_A = –40°C to +105°C			±6	
DYNAMIC CONVERTER CHARACTERISTICS						
SINAD	Signal-to-noise and distortion ratio	V_{IN} = –0.1 dBFS		82		dBc
		V_{IN} = –0.1 dBFS, T_A = –40°C to +105°C	80			
SNR	Signal-to-noise ratio	V_{IN} = –0.1 dBFS		82		dBc
		V_{IN} = –0.1 dBFS, T_A = –40°C to +105°C	80			
THD	Total harmonic distortion	V_{IN} = –0.1 dBFS		–97		dBc
SFDR	Spurious-free dynamic range	V_{IN} = –0.1 dBFS		98		dBc
ENOB	Effective number of bits	V_{IN} = –0.1 dBFS		13.4		Bits
		V_{IN} = –0.1 dBFS, T_A = –40°C to +105°C	13.0			
FPBW	–3-dB full-power bandwidth	Output at 70.7%FS with FS input, single-ended input		22		MHz
ANALOG INPUT CHARACTERISTICS						
V_{IN}	(+IN) – (–IN)	T_A = –40°C to +105°C	GND		V_{REF}	V
+IN	Noninverting input	T_A = –40°C to +105°C	–0.15		V_{REF} + 0.15	V
–IN	Inverting input	T_A = –40°C to +105°C	–0.15		0.15	V
I_{DCL}	DC leakage current	$V_{IN} = V_{REF}$ or $V_{IN} = 0$, T_A = –40°C to +105°C			±1	µA
C_{INA}	Input capacitance	In acquisition mode		14		pF
		In conversion mode		3.4		
CMRR	Common-mode rejection ratio	See the *Specification Definitions* section for the test condition		76		dB

(1) Typical values are at $T_J = 25°C$ and represent most likely parametric norms. Test limits are specified to TI's average outgoing quality level (AOQL).

ADC141S628-Q1 Converter Electrical Characteristics (continued)

The following specifications apply for $V_A = V_{IO} = 5$ V, $V_{REF} = 4.096$ V, and $f_{SCLK} = 0.9$ MHz to 3.6 MHz; $f_{IN} = 20$ kHz and $C_L = 25$ pF, unless otherwise noted. All specifications are at $T_A = 25°C$, unless otherwise noted.(1)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DIGITAL INPUT CHARACTERISTICS						
V_{IH}	Input high voltage			1.9		V
		T_A = –40°C to +105°C	2.3			
V_{IL}	Input low voltage			1.0		V
		T_A = –40°C to +105°C			0.7	
I_{IN}	Input current	V_{IN} = 0 V or V_A, T_A = –40°C to +105°C			±1	µA
C_{IND}	Input capacitance			2		pF
		T_A = –40°C to +105°C			4	
DIGITAL OUTPUT CHARACTERISTICS						
V_{OH}	Output high voltage	I_{SOURCE} = 200 µA		V_A – 0.05		V
		I_{SOURCE} = 200 µA, T_A = –40°C to +105°C	V_A – 0.2			
		I_{SOURCE} = 1 mA		V_A – 0.16		
V_{OL}	Output low voltage	I_{SINK} = 200 µA		0.01		V
		I_{SINK} = 200 µA, T_A = –40°C to +105°C			0.4	
		I_{SINK} = 1 mA		0.05		
I_{OZH}, I_{OZL}	Tri-state leakage current	Force 0 V or V_A, T_A = –40°C to +105°C			±1	µA
C_{OUT}	Tri-state output capacitance	Force 0 V or V_A		2		pF
		Force 0 V or V_A, T_A = –40°C to +105°C			4	
	Output coding			Straight binary		
POWER-SUPPLY CHARACTERISTICS						
V_A	Analog supply voltage range	T_A = –40°C to +105°C	4.5		5.5	V
V_{IO}	Digital input/output supply voltage range(2)	T_A = –40°C to +105°C	4.5		5.5	V
V_{REF}	Reference voltage range	T_A = –40°C to +105°C	1.0		V_A	V
I_{VA} (Conv)	Analog supply current, conversion mode	f_{SCLK} = 3.6 MHz, f_S = 200 kSPS		740		µA
		f_{SCLK} = 3.6 MHz, f_S = 200 kSPS, T_A = –40°C to +105°C			970	
I_{VIO} (Conv)	Digital I/O supply current, conversion mode	f_{SCLK} = 3.6 MHz, f_S = 200 kSPS		170		µA
		f_{SCLK} = 3.6 MHz, f_S = 200 kSPS, T_A = –40°C to +105°C			260	
I_{VREF} (Conv)	Reference current, conversion mode	f_{SCLK} = 3.6 MHz, f_S = 200 kSPS		45		µA
		f_{SCLK} = 3.6 MHz, f_S = 200 kSPS, T_A = –40°C to +105°C			80	
I_{VA} (PD)	Analog supply current, power-down mode ($\overline{CS}$ high)	f_{SCLK} = 3.6 MHz		8		µA
		f_{SCLK} = low		2		
		f_{SCLK} = low, T_A = –40°C to +105°C			3	
I_{VIO} (PD)	Digital I/O supply current, power-down mode ($\overline{CS}$ high)	f_{SCLK} = 3.6 MHz		3		µA
		f_{SCLK} = low		0.1		
		f_{SCLK} = low, T_A = –40°C to +105°C			0.7	

(2) The value of V_{IO} is independent of the value of V_A. For example, V_{IO} can be operating at 5 V while V_A is operating at 4.5 V or V_{IO} can be operating at 4.5 V while V_A is operating at 5 V.

ADC141S628-Q1 Converter Electrical Characteristics (continued)

The following specifications apply for $V_A = V_{IO} = 5$ V, $V_{REF} = 4.096$ V, and $f_{SCLK} = 0.9$ MHz to 3.6 MHz; $f_{IN} = 20$ kHz and $C_L = 25$ pF, unless otherwise noted. All specifications are at $T_A = 25°C$, unless otherwise noted.(1)

7 Detailed Description

7.1 Overview

The ADC141S628-Q1 is a 14-bit, 200-kSPS, sampling analog-to-digital converter (ADC). The converter uses a successive-approximation register (SAR) architecture based upon capacitive redistribution containing an inherent sample-and-hold function. The pseudo-differential nature of the analog inputs is maintained from the internal sample-and-hold circuits throughout the ADC to provide excellent common-mode signal rejection.

The ADC141S628-Q1 operates from independent analog and digital supplies. The analog supply (V_A) can range from 4.5 V to 5.5 V and the digital input/output supply (V_{IO}) can range from 4.5 V to 5.5 V. The ADC141S628-Q1 uses an external reference (V_{REF}), which can be any voltage between 1 V and V_A. The value of V_{REF} determines the range of the analog input, while the reference input current (I_{REF}) depends upon the conversion rate.

The analog input is presented across the two input pins: +IN and –IN. The –IN pin is connected to the sensor ground in order to reject any small ground noise that is common to the +IN and –IN. Upon initiation of a conversion, the differential input is sampled on the internal capacitor array. The inputs are disconnected from the internal circuitry while a conversion is in progress. The ADC141S628-Q1 features a zero-power track mode where the ADC is consuming the minimum amount of supply current while the internal sampling capacitor is tracking the applied analog input voltage. Zero-power track mode starts after the 16th falling edge of the serial clock.

The ADC141S628-Q1 communicates with other devices via a serial peripheral interface (SPI) that operates using three pins: chip-select bar ($\overline{CS}$), serial clock (SCLK), and serial data out (D_{OUT}). The external SCLK controls data transfer and serves as the conversion clock. The duty cycle of SCLK is essentially unimportant, provided the minimum clock high and low times are met. The minimum SCLK frequency is set by internal capacitor leakage. Each conversion requires 18 SCLK cycles to complete. If less than 14 bits of conversion data are required, $\overline{CS}$ can be brought high at any point during the conversion. This procedure of terminating a conversion prior to completion is commonly referred to as short cycling.

The digital conversion result is clocked out by the SCLK input and is provided serially, most significant bit (MSB) first, at the D_{OUT} pin. The digital data that is provided at the D_{OUT} pin is that of the conversion currently in progress and thus there is no pipe line delay.

7.2 Feature Description

7.2.1 Reference Input (V_{REF})

The externally supplied reference voltage (V_{REF}) sets the analog input range. The ADC141S628-Q1 will operate with V_{REF} in the range of 1 V to V_A.

Operation with V_{REF} below 1 V is also possible with slightly diminished performance. As V_{REF} is reduced, the range of acceptable analog input voltages is reduced. The peak-to-peak input range is limited to (V_{REF}).

Reducing V_{REF} also reduces the size of the least significant bit (LSB). The size of one LSB is equal to [(V_{REF}) / 2n], where n is 14. When the LSB size goes below the noise floor of the ADC141S628-Q1, the noise spans an increasing number of codes and overall performance suffers. For example, the SNR from dynamic signals degrades, while code uncertainty increases in DC measurements. Because the noise is Gaussian in nature, the effects of this noise can be reduced by averaging the results of a number of consecutive conversions.

Additionally, because offset and gain errors are specified in LSB, any offset or gain errors inherent in the ADC increase in terms of LSB size as V_{REF} is reduced.

V_{REF} and analog inputs (+IN and –IN) are connected to the capacitor array through a switch matrix when the input is sampled. Hence, I_{REF}, I_{+IN}, and $I_{–IN}$ are a series of transient spikes that occur at a frequency dependent on the operating sample rate of the ADC141S628-Q1.

I_{REF} changes only slightly with temperature. See Figure 29 for additional details.

Feature Description (continued)

7.2.2 Analog Signal Inputs

The ADC141S628-Q1 has a pseudo-differential input where the effective input voltage that is digitized is (+IN) – (–IN) and –IN is restricted to be close to ground. By using this differential input, small signals common to both inputs are rejected. As shown in Figure 31, noise is rejected well at low frequencies where the common-mode rejection ratio (CMRR) is 90 dB. As the frequency increases to 1 MHz, the CMRR rolls off to 40 dB.

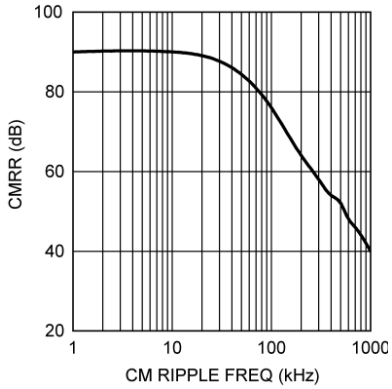

Figure 31. Analog Input CMRR vs Frequency

The current required to recharge the input sampling capacitor causes voltage spikes at +IN and –IN. Do not try to filter out these noise spikes. Rather, ensure that the transients settle out during the acquisition period.

7.2.3 Pseudo-Differential Operation

For pseudo-differential operation, the noninverting input (+IN) of the ADC141S628-Q1 can be driven with a signal that goes from GND to a voltage equal to or less than V_{REF}. Connect the inverting input (–IN) to either the local GND or the remote sensor ground. This connection allows +IN a maximum swing range of ground to V_{REF}. Figure 32 shows the ADC141S628-Q1 being driven by a full-scale single-ended source.

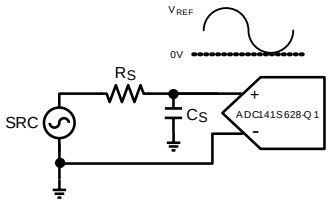

Figure 32. Single-Ended Input

Feature Description (continued)

7.2.4 Serial Digital Interface

The ADC141S628-Q1 communicates via a synchronous 3-wire serial interface as described in Figure 1 or re-shown in Figure 33 for convenience. $\overline{CS}$, chip-select bar, initiates conversions and frames the serial data transfers. SCLK (serial clock) controls both the conversion process and the timing of serial data. D_{OUT} is the serial data output pin, where a conversion result is sent as a serial data stream, MSB first.

A serial frame is initiated on the falling edge of $\overline{CS}$ and ends on the rising edge of $\overline{CS}$. The ADC141S628-Q1 D_{OUT} pin is in a high-impedance state when $\overline{CS}$ is high and is active when $\overline{CS}$ is low; thus, $\overline{CS}$ acts as an output enable.

The ADC141S628-Q1 samples the input upon the assertion of $\overline{CS}$. Assertion is defined as bringing the $\overline{CS}$ pin to a logic low state. For the first 15 periods of the SCLK following the assertion of $\overline{CS}$, the ADC141S628-Q1 is converting the analog input voltage. On the 16th falling edge of SCLK, the ADC141S628-Q1 enters acquisition (t_{ACQ}) mode. For the next three periods of SCLK, the ADC141S628-Q1 is operating in acquisition mode where the ADC input is tracking the analog input signal applied across +IN and –IN. During acquisition mode, the ADC141S628-Q1 is consuming a minimal amount of power.

The ADC141S628-Q1 can enter conversion mode (t_{CONV}) under three different conditions. The first condition involves $\overline{CS}$ going low (asserted) with SCLK high. In this case, the ADC141S628-Q1 enters conversion mode on the first falling edge of SCLK after $\overline{CS}$ is asserted. In the second condition, $\overline{CS}$ goes low with SCLK low. Under this condition, the ADC141S628-Q1 automatically enters conversion mode and the falling edge of $\overline{CS}$ is seen as the first falling edge of SCLK. In the third condition, $\overline{CS}$ and SCLK go low simultaneously and the ADC141S628-Q1 enters conversion mode. While there is no timing restriction with respect to the falling edges of $\overline{CS}$ and SCLK, there is a minimum and maximum setup time requirements for the falling edge of $\overline{CS}$ with respect to the rising edge of SCLK. See Figure 5 for more information.

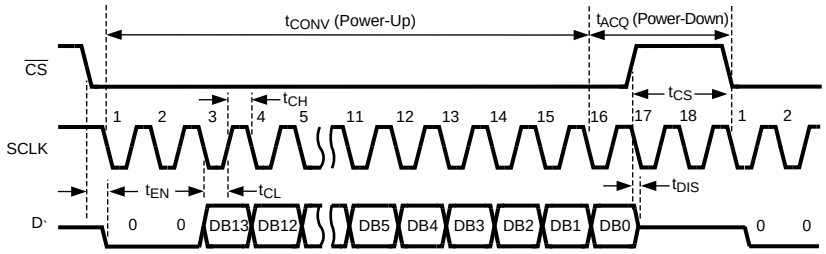

Figure 33. ADC141S628-Q1 Single Conversion Timing Diagram

7.2.5 $\overline{CS}$ Input

The $\overline{CS}$ (chip-select bar) input is active low and is TTL- and CMOS-compatible. The ADC141S628-Q1 enters conversion mode when $\overline{CS}$ is asserted and the SCLK pin is in a logic low state. When $\overline{CS}$ is high, the ADC141S628-Q1 is always in acquisition mode and thus consuming the minimum amount of power. Because $\overline{CS}$ must be asserted to begin a conversion, the sample rate of the ADC141S628-Q1 is equal to the assertion rate of $\overline{CS}$.

Proper operation requires that the fall of $\overline{CS}$ not occur simultaneously with a rising edge of SCLK. If the fall of $\overline{CS}$ occurs during the rising edge of SCLK, the data may be clocked out one bit early. Whether or not the data are clocked out early depends upon how close the $\overline{CS}$ transition is to the SCLK transition, the device temperature, and the characteristics of the individual device. To ensure that the MSB is always clocked out at a given time (the third falling edge of SCLK), the fall of $\overline{CS}$ must always meet the timing requirement specified in the *ADC141S628-Q1 Timing Requirements* table.

7.2.6 SCLK Input

The SCLK (serial clock) is used as the conversion clock to shift out the conversion result. SCLK is TTL- and CMOS-compatible. Internal settling time requirements limit the maximum clock frequency while internal capacitor leakage limits the minimum clock frequency. The ADC141S628-Q1 offers specified performance with the clock rates indicated in the *ADC141S628-Q1 Converter Electrical Characteristics* table.

Feature Description (continued)

The ADC141S628-Q1 enters acquisition mode on the 16th falling edge of SCLK during a conversion frame. Assuming that the LSB is clocked into a controller on the 16th rising edge of SCLK, there is a minimum acquisition time period that must be met before a new conversion frame can begin. Other than the 16th rising edge of SCLK that was used to latch the LSB into a controller, there is no requirement for the SCLK to transition during acquisition mode. Therefore, SCLK can be idle after the LSB is latched into the controller.

7.2.7 Data Output

The data output format of the ADC141S628-Q1 is straight binary, as shown in Figure 34. This figure indicates the ideal output code for a given input voltage and does not include the effects of offset, gain error, linearity errors, or noise. Each data output bit is output on the falling edges of SCLK. The first and second SCLK falling edges clock out leading zeros while the third to 16th SCLK falling edges clock out the conversion result, MSB first.

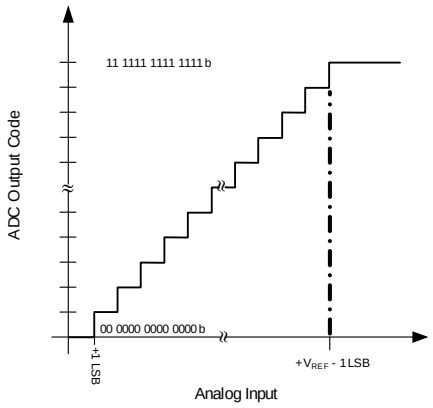

Figure 34. ADC Output vs Input

While most receiving systems capture the digital output bits on the rising edges of SCLK, the falling edges of SCLK may be used to capture the conversion result if the minimum hold time for D_{OUT} is acceptable. See Figure 4 for D_{OUT} hold (t_{DH}) and access (t_{DA}) times.

D_{OUT} is enabled on the falling edge of $\overline{CS}$ and disabled on the rising edge of $\overline{CS}$. If $\overline{CS}$ is raised prior to the 16th falling edge of SCLK, the current conversion is aborted and D_{OUT} goes into its high impedance state. A new conversion begins when $\overline{CS}$ is driven LOW.

7.3 Device Functional Modes

7.3.1 Power Consumption

The architecture, design, and fabrication process allow the ADC141S628-Q1 to operate at conversion rates up to 200 kSPS while consuming very little power. The ADC141S628-Q1 consumes the least amount of power while operating in acquisition (power-down) mode. For applications where power consumption is critical, operate the ADC141S628-Q1 in acquisition mode as often as the application tolerates. To further reduce power consumption, stop the SCLK while $\overline{CS}$ is high.

7.3.1.1 Short Cycling

Short cycling refers to the process of halting a conversion after the last needed bit is outputted. Short cycling can be used to lower the power consumption in those applications that do not need a full 14-bit resolution, or where an analog signal is being monitored until some condition occurs. In some circumstances, the conversion can be terminated after the first few bits. This termination lowers power consumption in the converter because the ADC141S628-Q1 spends more time in acquisition mode and less time in conversion mode.

Short cycling is accomplished by pulling $\overline{CS}$ high after the last required bit is received from the ADC141S628-Q1 output. This cycling is possible because the ADC141S628-Q1 places the latest converted data bit on D_{OUT} as the bit is generated. If only 10-bits of the conversion result are needed, for example, the conversion can be terminated by pulling $\overline{CS}$ high after the 10th bit has been clocked out.

Device Functional Modes (continued)

7.3.1.2 Burst Mode Operation

Normal operation of the ADC141S628-Q1 requires the SCLK frequency to be 18 times the sample rate and the $\overline{CS}$ rate to be the same as the sample rate. However, in order to minimize power consumption in applications requiring sample rates below 200 kSPS, run the ADC141S628-Q1 with an SCLK frequency of 3.6 MHz and a $\overline{CS}$ rate as slow as the system requires. When this set up is accomplished, the ADC141S628-Q1 operates in burst mode. The ADC141S628-Q1 enters into acquisition mode at the end of each conversion, minimizing power consumption, which causes the converter to spend the longest possible time in acquisition mode. Because power consumption scales directly with conversion rate, minimizing power consumption requires determining the lowest conversion rate that will satisfy the requirements of the system.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Application Circuits

The following figure is an example of the ADC141S628-Q1 in a typical application circuit. This circuit is basic and generally requires modification for specific circumstances.

8.1.1.1 Data Acquisition

Figure 35 shows a typical connection diagram for the ADC141S628-Q1 operating at V_A of 5 V. V_{REF} is connected to a 4.1-V shunt reference, the LM4040-4.1, to define the analog input range of the ADC141S628-Q1 independent of supply variation on the 5-V supply line. Decouple the V_{REF} pin to the ground plane by a 0.1-µF ceramic capacitor and a tantalum capacitor of 10 µF. The 0.1-µF capacitor must be placed as close as possible to the V_{REF} pin while the placement of the tantalum capacitor is less critical. The V_A and V_{IO} pins of the ADC141S628-Q1 are also recommended to be decoupled to ground by a 0.1-µF ceramic capacitor in parallel with a 10-µF tantalum capacitor.

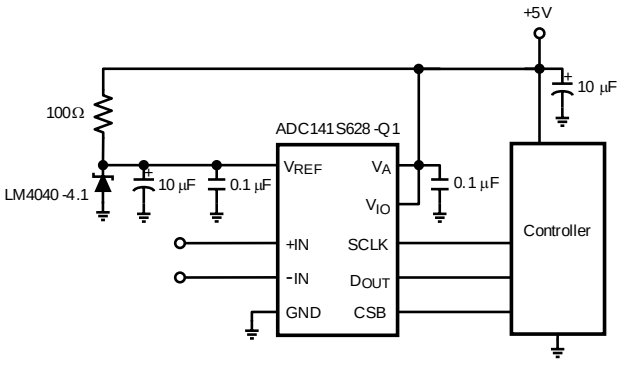

Figure 35. Low-Cost, Low-Power Data Acquisition System

9 Power Supply Recommendations

9.1 Analog and Digital Power Supplies

Any ADC architecture is sensitive to spikes on the power supply, reference, and ground pins. These spikes may originate from switching power supplies, digital logic, high power devices, and other sources. Power to the ADC141S628-Q1 must be clean and well bypassed. Use a 0.1-µF ceramic bypass capacitor and a 1-µF to 10-µF capacitor to bypass the ADC141S628-Q1 supply, with the 0.1-µF capacitor placed as close to the ADC141S628-Q1 package as possible.

Because the ADC141S628-Q1 has both the V_A and V_{IO} pins, the user has three options on how to connect these pins. The first option is to tie V_A and V_{IO} together and power them with the same power supply. This connection is the most cost effective way of powering the ADC141S628-Q1 but is also the least ideal. As stated previously, noise from V_{IO} can couple into V_A and adversely affect performance. The other two options involve the user powering V_A and V_{IO} with separate supply voltages. These supply voltages can have the same amplitude or they can be different. These voltages may be set independent of each other and can be any value between 4.5 V and 5.5 V.

Best performance is typically achieved with V_A operating at 5 V. Operating V_A at 5 V offers the best linearity and dynamic performance when V_{REF} is also set to 5 V.

9.2 Voltage Reference

The reference source must have a low output impedance and must be bypassed with a minimum capacitor value of 0.1 µF. A larger capacitor value of 1 µF to 10 µF placed in parallel with the 0.1-µF capacitor is preferred. While the ADC141S628-Q1 draws very little current from the reference on average, there are higher instantaneous current spikes at the reference.

The V_{REF} of the ADC141S628-Q1, like all ADCs, does not reject noise or voltage variations. Keep this fact in mind if V_{REF} is derived from the power supply. Any noise or ripple from the supply that is not rejected by the external reference circuitry appears in the digital results. The use of an active reference source is recommended. The LM4040 and LM4050 shunt reference families and the LM4132 and LM4140 series reference families are excellent choices for a reference source.

10 Layout

10.1 Layout Guidelines

For best performance, care must be taken with the physical layout of the printed circuit board, which is especially true with a low V_{REF} or when the conversion rate is high. At high clock rates there is less time for settling, so any noise must settle out before the conversion begins.

10.1.1 PCB Layout

Capacitive coupling between the noisy digital circuitry and the sensitive analog circuitry can lead to poor performance. The solution is to keep the analog circuitry separated from the digital circuitry and the clock line as short as possible. Digital circuits create substantial supply and ground current transients. The logic noise generated can have significant impact upon system noise performance. To avoid performance degradation of the ADC141S628-Q1 because of supply noise, avoid using the same supply for the V_A and V_{REF} of the ADC141S628-Q1 that is used for digital circuitry on the board.

Generally, analog and digital lines must cross each other at 90° to avoid crosstalk. However, to maximize accuracy in high resolution systems, avoid crossing analog and digital lines altogether. Clock lines must be kept as short as possible and isolated from all other lines, including other digital lines. In addition, the clock line must also be treated as a transmission line and be properly terminated. Isolate the analog input from noisy signal traces to avoid coupling of spurious signals into the input. Any external component (for example, a filter capacitor) connected between the converter input pins and ground or to the reference input pin and ground must be connected to a very clean point in the ground plane.

A single, uniform ground plane and the use of split power planes are recommended. Place the power planes within the same board layer. All analog circuitry (input amplifiers, filters, reference components, and so forth) must be placed over the analog power plane. Place all digital circuitry over the digital power plane. Furthermore, the GND pins on the ADC141S628-Q1 and all the components in the reference circuitry and input signal chain that are connected to ground must be connected to the ground plane at a quiet point. Avoid connecting these points too close to the ground point of a microprocessor, microcontroller, digital signal processor, or other high power digital device.

11 Device and Documentation Support

11.1 Device Support

11.1.1 Device Nomenclature

11.1.1.1 Specification Definitions

APERTURE DELAY is the time between the first falling edge of SCLK and the time when the input signal is sampled for conversion.

COMMON-MODE REJECTION RATIO (CMRR) is a measure of how well in-phase signals common to both input pins are rejected.

To calculate CMRR, the change in output offset is measured while the common mode input voltage is changed from 2 V to 3 V.

CMRR = 20 LOG (Δ Common Input / Δ Output Offset) (1)

CONVERSION TIME is the time required, after the input voltage is acquired, for the ADC to convert the input voltage to a digital word.

DIFFERENTIAL NONLINEARITY (DNL) is the measure of the maximum deviation from the ideal step size of 1 LSB.

DUTY CYCLE is the ratio of the time that a repetitive digital waveform is high to the total time of one period. The specification here refers to the SCLK.

EFFECTIVE NUMBER OF BITS (ENOB, or EFFECTIVE BITS) is another method of specifying signal-to-noise and distortion or SINAD. ENOB is defined as (SINAD − 1.76) / 6.02 and says that the converter is equivalent to a perfect ADC of this (ENOB) number of bits.

FULL POWER BANDWIDTH is a measure of the frequency at which the reconstructed output fundamental drops 3 dB below its low frequency value for a full-scale input.

FULL-SCALE ERROR is the difference between the input voltage at which the output code transitions to positive full-scale and V_{REF} minus 1 LSB.

GAIN ERROR is the deviation from the ideal slope of the transfer function. Gain error is the difference between positive full-scale error and negative full-scale error and can be calculated as:

Gain Error = Positive Full-Scale Error − Negative Full-Scale Error (2)

INTEGRAL NONLINEARITY (INL) is a measure of the deviation of each individual code from a line drawn from ½ LSB below the first code transition through ½ LSB above the last code transition. The deviation of any given code from this straight line is measured from the center of that code value.

MISSING CODES are those output codes that will never appear at the ADC outputs. The ADC141S628-Q1 is specified not to have any missing codes.

OFFSET ERROR is the difference between the input voltage at which the output code transitions from code 0000h to 0001h and 1 LSB.

POST CALIBRATION TOTAL UNADJUSTED ERROR is the total unadjusted error over the temperature range after system calibration to remove gain and offset errors at 25°C.

POWER-SUPPLY REJECTION RATIO (PSRR) is a measure of how well a change in the analog supply voltage is rejected. PSRR is calculated from the ratio of the change in offset error for a given change in supply voltage, expressed in dB. For the ADC141S628-Q1, V_A is changed from 4.5 V to 5.5 V.

PSRR = 20 LOG (Δ Output Offset / Δ V_A) (3)

SIGNAL-TO-NOISE RATIO (SNR) is the ratio, expressed in dB, of the rms value of the input signal to the rms value of the sum of all other spectral components below one-half the sampling frequency, not including harmonics or DC.

SIGNAL-TO-NOISE AND DISTORTION (S/N+D or SINAD) Is the ratio, expressed in dB, of the rms value of the input signal to the rms value of all of the other spectral components below one-half the sampling frequency, including harmonics but excluding DC.

Device Support (continued)

SPURIOUS-FREE DYNAMIC RANGE (SFDR) is the difference, expressed in dB, between the desired signal amplitude to the amplitude of the peak spurious spectral component below one-half the sampling frequency, where a spurious spectral component is any signal present in the output spectrum that is not present at the input and may or may not be a harmonic.

TOTAL HARMONIC DISTORTION (THD) is the ratio of the rms total of the first five harmonic components at the output to the rms level of the input signal frequency as seen at the output, expressed in dB. THD is calculated as:

$$THD = 20 \cdot \log_{10} \sqrt{\frac{A_{f2}^2 + \cdots + A_{f6}^2}{A_{f1}^2}} \quad (4)$$

where

- A_{f1} is the RMS power of the input frequency at the output
- A_{f2} through A_{f6} are the RMS power in the first five harmonic frequencies

TOTAL UNADJUSTED ERROR is the difference between the parts transfer function and the ideal transfer function.

THROUGHPUT TIME is the minimum time required between the start of two successive conversion.

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADC141S628QIMM/NOPB	ACTIVE	VSSOP	DGS	10	1000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 105	X96Q	Samples
ADC141S628QIMMX/NOPB	ACTIVE	VSSOP	DGS	10	3500	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 105	X96Q	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
