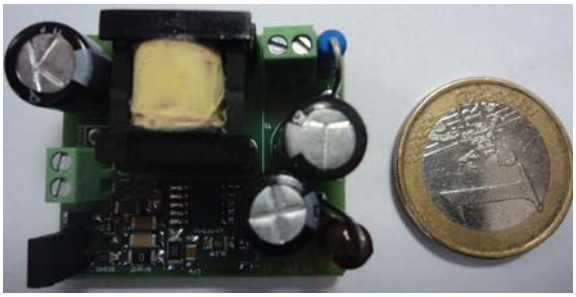
STEVAL-ISA113V1

Wide range single-output demonstration board based on the VIPER06HS

Data brief

Features

- Universal input mains range:
  - input voltage 90 - 265 V_{AC}
  - frequency 45 - 65 Hz
- Single-output voltage: 12 V at 0.35 A continuous operation
- Standby mains consumption: < 30 mW at 230 V_{AC}
- Average efficiency: > 74%
- Fully protected against faults (overload, feedback disconnection and overheating)
- EMI: according to EN55022-Class-B
- RoHS compliant



STEVAL-ISA113V1

Description

The STEVAL-ISA113V1 demonstration board is a 12 V-0.35 A power supply set in non-isolated flyback topology using the new VIPER06HS offline high-voltage converter by STMicroelectronics.

The features of the device include an 800 V avalanche rugged power section, PWM operation at 115 kHz with frequency jittering for lower EMI, current limiting with adjustable set point, onboard soft-start, a safe auto-restart after a fault condition and a low standby power.

The protection features available include a thermal shutdown with hysteresis, delayed overload protection, and open loop failure protection.

1 Adapter features

The electrical specifications are given in *Table 1*, the schematic in *Figure 1*, and the bill of material in *Table 2*.

Table 1. Electrical specifications

Parameter	Symbol	Value
Input voltage range	V_{IN}	[90 V_{AC}; 265 V_{AC}]
Output voltage	V_{OUT}	12 V
Max. output current	I_{OUT}	0.35 A
Precision of output regulation	ΔV_{OUT_LF}	±5%
High frequency output voltage ripple	ΔV_{OUT_HF}	50 mV
Max. ambient operating temperature	T_{AMB}	60 °C

The transformer core is a standard E13. The output voltage value is set in a simple way through the RfbH-RfbL voltage divider between the output terminal and the FB pin, according to the following formula:

Equation 1

$$V_{OUT} = 3.3V \cdot \left(1 + \frac{RfbH}{RfbL}\right)$$

In the schematic, RfbH has been split into RfbH1 and RfbH2; and RfbL into RfbL1 and RfbL2 in order to allow a better tuning of the output voltage value.

If the jumper J1 is not selected, the IC is biased through the internal HV-startup current generator (“self-biasing”).

If low standby consumption and good efficiency performance are required, the HV-startup current generator must be excluded. This can be done selecting the jumper J1, which connects the output terminal to the V_{DD} pin through a small signal diode. The IC biasing through the output is referred to as “external biasing”.
