Protective field switching between two S3000 with static inputs

S3000 Advanced with S3000 Advanced in conjunction with relays/contactors

Operating mode: without restart interlock, with external device monitoring (EDM)

Protective field switching by means of control input A and control input B on separate OSSD pairs (simultaneous monitoring) **Comments** 

<sup>1)</sup> Output circuits: These contacts are to be connected to the controller such that, with the output circuit open, the dangerous state is disabled. For categories 4 and 3, this integration must be dual-channel (x/y paths). Single-channel insertion in the control (z path) is only possible with a single-channel control and by taking the risk analysis into account.
