

DESCRIPTION

The HY62C256 is a high speed low power, 32,768 words by 8-bit CMOS static RAM fabricated using HYUNDAI's high performance twin tub CMOS process. This high reliability process coupled with innovative circuit design techniques, yields maximum access time of 85ns.

The HY62C256 has a data retention mode that guarantees data will remain valid at a minimum power supply voltage of 2.0 volt.

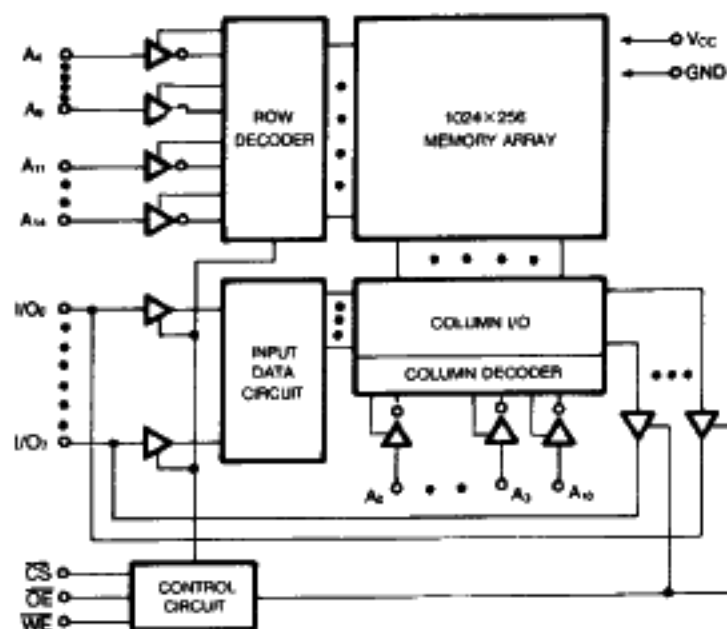

Using CMOS technology, supply voltages from 2.0 to 5.5 volt have little effect on supply current in data retention mode. Reducing the supply voltage to minimize current drain is unnecessary with the HY62C256 family.

FEATURES

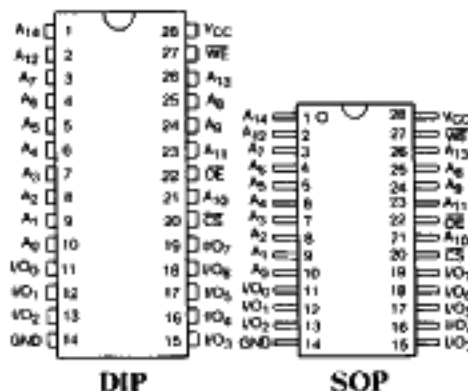

- High speed — 85/100/120/150 ns (max.)
- Low power consumption
 - 175mW typical operating
 - 15 μ W typical standby (L-version)
- Battery back up (L-version)
 - 2 volt data retention
- Fully static operation
 - No clock or refresh required
- All inputs and outputs directly TTL compatible
- Tri-state output
- High reliability 28 pin 600 mil P-DIP and 330 mil SOP

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

SYMBOL	PARAMETER	RATING	UNIT
V _{DD} , V _{IN} , V _{IO}	Power Supply, Input, Input/Output Voltage	-0.5 ⁽²⁾ to 7.0	V
T _{BIAS}	Temperature Under Bias	-10 to 125	°C
T _{STG}	Storage Temperature	-65 to 150	°C
P _D	Power Dissipation	1.0	W
I _{OUT}	Data Output Current	50	mA

NOTES:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended may affect reliability.

2. -3.5V for 20ns pulse.

RECOMMENDED DC OPERATING CONDITIONS

(T_A=0°C to 70°C)

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
V _{CC}	Supply Voltage	4.5	5.0	5.5	V
V _{IH}	Input High Voltage	2.2	3.5	6.0	V
V _{IL}	Input Low Voltage	-0.5 ⁽¹⁾	-	0.8	V

NOTE:

1. -3.5V for 20 ns pulse.

TIMING DIAGRAMS

READ CYCLE 1⁽¹⁾READ CYCLE 2^(1, 2, 4)READ CYCLE 3^(1, 3, 4)

NOTES:

1. WE is high for Read Cycle.
2. Device is continuously selected. $\overline{CS} = V_{IL}$.
3. Addresses are valid prior to or coincident with \overline{CS} transition low.
4. $\overline{OE} = V_{IL}$.
5. Transition is measured $\pm 500\text{mV}$ from steady state. This parameter is sampled and not 100% tested.

HY62C256 32,768×8-Bit CMOS SRAM

T-46-23-13

WRITE CYCLE 1

HY62C256 32,768×8-Bit CMOS SRAM

T-46-23-13

WRITE CYCLE 2⁽⁵⁾

NOTES :

1. A write occurs during the overlap (t_{WP}) of low \overline{CS} and low \overline{WE} .
2. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going high at the end of write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
4. If the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transition, outputs remain in a high impedance state.
5. \overline{OE} is continuously low ($\overline{OE} = V_{IL}$).
6. D_{OUT} is the same phase of write data of this write cycle.
7. D_{OUT} is the read data of next address.
8. If \overline{CS} is low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
9. Transition is measured $\pm 500mV$ from steady state. This parameter is sampled and not 100% tested.
