

SY02-HP20

Date: January 20, 2004

- **INTRODUCTION**

The SY02-HP20 is a high frequency crystal-based PLL synchronizer designed as a module level subsystem for easy incorporation into telecommunication equipment.

- **FEATURES**

- Low jitter output from intrinsically low jitter VCXO or VCXO;
- One pre-selected input reference of **8kHz to 77.76MHz** (CMOS levels);
- Two pairs of high frequency differential LVPECL outputs up to **800MHz**. (must be at the same frequency)
- Alarms and status;
- Provides free running clock output;
- The unit changes timing modes in response to external events;
- J-TAG service port for re-programming and servicing;
- 3.3V DC power supply
- Small dimensions: 0.75" x 1.20" SMT pkg.

- **APPLICATIONS**

- ATM
- SDH
- PDH
- SONET
- Other telecommunication equipment.

• **DESCRIPTION**

The SY02-HP20 is a High Frequency Phase Lock Loop has been designed as a module level subsystem for easy incorporation into telecommunication equipment. The module generates the high frequency (up to 622.08MHz) output from a low jitter VCXO or VCSO (SAW based oscillators). The output can be disabled externally by setting OUTEN pin high. The SY02-HP20 can be locked to one reference of a pre-selected input frequency between 8 kHz to 77.76MHz. The module has fast locking time and tolerates reference inputs with different duty cycles. The loop bandwidth is optimized according to used VCXO and wanted output performance. The SMD package dimensions are 0.75x1.20 inch and power supply is 3.3V. Parts are assembled using high temperature solder to withstand surface mount reflow process.
