

FPBL20SM60

Smart Power Module (SPM)

General Description

FPBL20SM60 is an advanced smart power module (SPM) that Fairchild has newly developed and designed to provide very compact and low cost, yet high performance ac motor drives mainly targeting medium speed low-power inverter-driven application like air conditioners. It combines optimized circuit protection and drive matched to low-loss IGBTs. Highly effective short-circuit current detection/protection is realized through the use of advanced current sensing IGBT chips that allow continuous monitoring of the IGBTs current. System reliability is further enhanced by the integrated under-voltage lock-out protection. The high speed built-in HVIC provides opto-coupler-less IGBT gate driving capability that further reduce the overall size of the inverter system design. In addition the incorporated HVIC facilitates the use of single-supply drive topology enabling the FPBL20SM60 to be driven by only one drive supply voltage without negative bias.

Features

- UL Certified No. E209204
- 600V-20A 3-phase IGBT inverter bridge including control ICs for gate driving and protection
- Single-grounded power supply due to built-in HVIC
- Typical switching frequency of 7kHz
- Inverter power rating of 1.4kW / 100~253 Vac
- Isolation rating of 2500Vrms/min.
- Very low leakage current due to using ceramic substrate
- Adjustable current protection level by varying series resistor value with sense-IGBTs

Applications

- AC 100V ~ 253V three-phase inverter drive for small power (1.4kW) ac motor drives
- Home appliances applications requiring medium switching frequency operation like air conditioners drive system
- Application ratings:
 - Power : 1.4kW / 100~253 Vac
 - Switching frequency : Typical 7kHz (PWM Control)
 - 100% load current : 10A (Irms)

Integrated Power Functions

- 600V-20A IGBT inverter for three-phase DC/AC power conversion (Please refer to Fig. 3)

Integrated Drive, Protection and System Control Functions

- For inverter high-side IGBTs: Gate drive circuit, High voltage isolated high-speed level shifting
Control circuit under-voltage (UV) protection
Note) Available bootstrap circuit example is given in Figs. 10, 15 and 16.
- For inverter low-side IGBTs: Gate drive circuit, Short circuit protection (SC)
Control supply circuit under-voltage (UV) protection
- Fault signaling: Corresponding to a SC fault (Low-side IGBTs) or a UV fault (Low-side supply)
- Input interface: 5V CMOS/LSTTL compatible, Schmitt trigger input

Internal Equivalent Circuit and Input/Output Pins

Note

1. Inverter low-side ((1) - (12) pins) is composed of three sense-IGBTs including freewheeling diodes for each IGBT and one control IC which has gate driving, current sensing and protection functions.
2. Inverter power side ((13) - (17) pins) is composed of two inverter dc-link input terminals and three inverter output terminals.
3. Inverter high-side ((18) - (30) pins) is composed of three normal-IGBTs including freewheeling diodes and three drive ICs for each IGBT.

Note

- Short-circuit current protection is functioning only at the low-sides. It would be recommended that the value of the external sensing resistor (R_{SC}) should be selected around 56 Ω in order to make the SC trip-level of about 30A.
Please refer to Fig. 7 which shows the current sensing characteristics according to sensing resistor R_{SC} .
- The fault-out pulse width t_{FOD} depends on the capacitance value of C_{FOD} according to the following approximate equation : $C_{FOD} = 18.3 \times 10^{-6} \times t_{FOD}[\text{F}]$

Note

- 6. Do not make over torque or mounting screws. Much mounting torque may cause ceramic cracks and bolts and AI heat-fin destruction.
- 7. Avoid one side tightening stress. Fig.9 shows the recommended torque order for mounting screws. Uneven mounting can cause the SPM ceramic substrate to be damaged.

ICs Internal Structure and Input/Output Conditions

Note

1. One LVIC drives three Sense-IGBTs and can do short-circuit current protection also. Three sense emitters are commonly connected to R_{SC} terminal to detect short-circuit current. Low-side part of the inverter consists of three sense-IGBTs
2. One HVIC drives one normal-IGBT. High-side part of the inverter consists of three normal-IGBTs
3. Each IC has under voltage detection and protection function.
4. The logic input is compatible with standard CMOS or LSTTL outputs.
5. $R_P C_P$ coupling at each input/output is recommended in order to prevent the gating input/output signals oscillation and it should be as close as possible to each SPM gating input pin.
6. It would be recommended that the bootstrap diode, D_{BS} , has soft and fast recovery characteristics.

Fig. 13. Short-circuit Current Protection (Low-side Operation only)

Note
It would be recommended that by-pass capacitors for the gating input signals, $IN_{(xx)}$ should be placed on the SPM pins and on the both sides of CPU and SPM for the fault output signal, V_{FO} , as close as possible.

Fig. 14. Recommended CPU I/O Interface Circuit

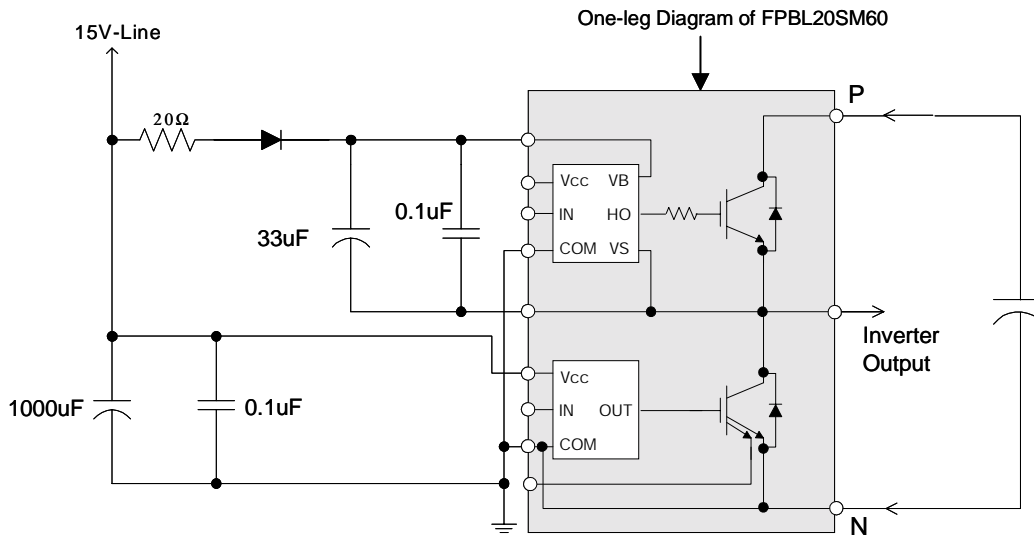

Fig. 15. Recommended Bootstrap Operation Circuit and Parameters

Note

1. $R_P C_{PL} / R_P C_{PH}$ coupling at each SPM input is recommended in order to prevent input signals' oscillation and it should be as close as possible to each SPM input pin.
2. By virtue of integrating an application specific type HVIC inside the SPM, direct coupling to CPU terminals without any opto-coupler or transformer isolation is possible.
3. V_{FO} output is open collector type. This signal line should be pulled up to the positive side of the 5V power supply with approximately 4.7k Ω resistance. Please refer to Fig. 14.
4. C_{SP15} of around 7 times larger than bootstrap capacitor C_{BS} is recommended.
5. V_{FO} output pulse width should be determined by connecting an external capacitor (C_{FOD}) between C_{FOD} (pin7) and $COM_{(L)}$ (pin2). (Example : if $C_{FOD} = 5.6$ nF, then $t_{FO} = 300$ μ s (typ.)) Please refer to the note 5 for calculation method.
6. Each input signal line should be pulled up to the 5V power supply with approximately 4.7k Ω resistance (other RC coupling circuits at each input may be needed depending on the PWM control scheme used and on the wiring impedance of the system's printed circuit board). Approximately a 0.22–2nF by-pass capacitor should be used across each power supply connection terminals.
7. To prevent errors of the protection function, the wiring around R_{SC} , R_F and C_{SC} should be as short as possible.
8. In the short-circuit protection circuit, please select the $R_F C_{SC}$ time constant in the range 3–4 μ s. R_F should be at least 30 times larger than R_{SC} . (Recommended Example: $R_{SC} = 56$ Ω , $R_F = 3.9k\Omega$ and $C_{SC} = 1$ nF)
9. Each capacitor should be mounted as close to the pins of the SPM as possible.
10. To prevent surge destruction, the wiring between the smoothing capacitor and the P&N pins should be as short as possible. The use of a high frequency non-inductive capacitor of around 0.1–0.22 μ F between the P&N pins is recommended.
11. Relays are used at almost every systems of electrical equipments of home appliances. In these cases, there should be sufficient distance between the CPU and the relays. It is recommended that the distance be 5cm at least
