- Handle this document carefully for it contains material protected by international copyright law. Any reproduction, full or in part, of this material is prohibited without the express written permission of the company.
- When using the products covered herein, please observe the conditions written herein and the precautions outlined in the following paragraphs. In no event shall the company be liable for any damages resulting from failure to strictly adhere to these conditions and precautions.

(1) The products covered herein are designed and manufactured for the following application areas. When using the products covered herein for the equipment listed in Paragraph (2), even for the following application areas, be sure to observe the precautions given in Paragraph (2). Never use the products for the equipment listed in Paragraph (3).

- Office electronics
- Instrumentation and measuring equipment
- Machine tools
- Audiovisual equipment
- Home appliances
- Communication equipment other than for trunk lines

(2) Those contemplating using the products covered herein for the following equipment which demands high reliability, should first contact a sales representative of the company and then accept responsibility for incorporating into the design fail-safe operation, redundancy, and other appropriate measures for ensuring reliability and safety of the equipment and the overall system.

- Control and safety devices for airplanes, trains, automobiles, and other transportation equipment
- Mainframe computers
- Traffic control systems
- Gas leak detectors and automatic cutoff devices
- Rescue and security equipment
- Other safety devices and safety equipment, etc.

(3) Do not use the products covered herein for the following equipment which demands extremely high performance in terms of functionality, reliability, or accuracy.

- Aerospace equipment
- Communications equipment for trunk lines
- Control equipment for the nuclear power industry
- Medical equipment related to life support, etc.

(4) Please direct all queries and comments regarding the interpretation of the above three Paragraphs to a sales representative of the company.

- Please direct all queries regarding the products covered herein to a sales representative of the company.

## 1. General Descriptions

The SHARP ID244K01, which panel design is SHARP standard, is a 16MB Flash Memory PC Card conforms to PCMCIA Release 2.0 and is offered to customers giving aim to confirm an external shape or electrical performances of the card. Before mass production, we will create a new product name dedicated for a customer and also present a specification which implies customer's request including panel design.

Alternate Byte Write Setup/Write	2	Write	W A	10H/ (1010H)	Write	W A	W D	—

- Note) 1. This Table shows the basic form of Erase, Verify and Program Verify.  
Refer Programming Flowchart, Erase Algorithm in detail.
2. Bus operations are defined in function table in page.
3. I A : Device Identifier Address    I I D : Device Identifier Data

	D A	I A			I I D	
		8Bits (Even Device)	8Bits (Odd Device)	16Bits	Byte (8Bits)	Word (16Bits)
Manufacturer Code	000000H~1FFFFFFH	000000H	000001H	000000H	89H	8989H
Device Code	000000H~1FFFFFFH	000002H	000003H	000001H	A6H	A6A6H

R A : Read Address    W A : Write Address    W D : Write Data  
 D A : Device Address (Any Address in device is acceptable.)  
 B A : Erase Block Address (Erase Size is 64k Bytes.)  
 S R D : Status Register Data

4. Either 40H(4040H) or 10H(1010H) are recognized by the WSM as the Byte Write Setup Command.

- a) Read Array/Reset Command:(FFH/FFFFH)  
By writing this command, device/devices pair become read mode. The device remains enable for reads until the Command User Interface contents are altered.
- b) Intelligent Identifier Command:(90H/9090H):  
After writing this command into the Command User Interface, a read cycle retrieves the manufacturer Code and device Code. To terminate the Operation, it is necessary to write another valid command into the register.
- c) Read Status Register Command:(70H/7070H):  
By Writing this command, the Status Register may be read at any time to determine when a byte or block erase operation is complete, and whether that operation completed successfully. Refer to Status Register definition in page. 9 . After writing this command, all subsequent read operations output data from the Status Register, until another valid command is written to the Command User Interface.
- d) Clear Status Register Command:(50H/5050H)  
Status bits which show error, the Erase Status(SR. 5), Byte Write Status(SR. 4) bits and the Vpp Status bit(SR. 3) can be reset by the Clear Status Machine Register Command.
- e) Erase Setup/Erase Command:(20H/2020H)/(D0H/D0D0H):  
Erase is executed one block(64kB for 1 device, 128kB for 2 devices) at a time.  
This command is functional when Vpp=VppH and an Erase Setup Command is first written to the Command User Interface, followed by the Erase Confirm Command. After that, the device automatically outputs Status Register data when read. The CPU can detect the completion of the erase event by analyzing the output of the RDY/BSY pin, or the WSM Status bit of the Status Register. When erase is completed, the Erase Status bit should be checked.  
If erase error is detected, the Status Register should be cleared.
- f) Erase Suspend/Erase Resume Command:(B0H/B0B0H)/(D0H/D0D0H)  
The Erase Suspend command allows block erase interruption in order to read data from another block of memory. The device continues to output Status Register data when read, after the Erase Suspend Command is written. Polling the WSM Status and Erase Suspend Status bits will determine when the erase operation has been suspended. RDY/BSY pin will also transition to V<sub>OH</sub>. At this point, a Read Array Command can be written to the Command User Interface to read data from blocks other than that which is suspended. Vpp must remain at VppH while device is in Erase Suspend. Erase Resume Command , at which time the WSM will continue with the erase process. The Erase Suspend Status and WSM Status bits of the Status Register will be automatically cleared and RDY/BSY pin will return to V<sub>OL</sub>. After the Erase Resume is written, the device automatically output Status Register data when read.
- g) Byte Write Setup/Write Command:(40H/4040H) or (10H/1010H)  
This command is functional when Vpp=VppH and an Byte Write Setup Command is first written to the Command User Interface, followed by a second write specifying the address and data to be written. The WSM then take over, controlling the byte write and write verify algorithms internally. After the two command byte sequence is written to it, the device automatically outputs Status Register data when read. The CPU can detect the completion of the byte write event by analyzing the output of the RDY/BSY pin , or the WSM Status bits of the Status Register.

### 5.4 Status Register

The memory devices in this card have Status Register which shows state of the device.

13. Voltage Timing ( $T_a = 25^\circ C$ )

PARAMETER	SYMBOL	MIN	MAX	UNIT
CE Setup Time	$t_{su}(CE)$	4.0	-	ms
CE Recovery Time	$t_{rec}(CE)$	1.0	-	$\mu s$
Vcc Falling Time	$t_f$	3.0	300	ms

Note)

- When  $V_{cc}(4.5\sim 5.5V)$  is applied to the memory card and you are inserting or removing the card,  $\overline{CE1}$ ,  $\overline{CE2}$  should both be high-impedance. At such a time, other signal line should also be hi-impedance. After inserting the memory card, do not access it during the  $\overline{CE}$  setup time (minimum of 4ms). (During this time, neither  $\overline{CE1}$  nor  $\overline{CE2}$ ="LOW".)
- When  $V_{cc}$  is turn on, if the condition (for example,  $V_{cc}$  rising time, etc) is not sufficient to as specified, it is possible that device's Status Register is not cleared or device not becomes to Read Array Mode. To prevent these, it is recommended that using software command, reset the Status Register or set the device to Read Array Mode.

ex.

Reset the Status Register    50H(5050H)  
 Set to Read Array Mode      FFH(FFFFH)

## 14. Attribute Memory

The attribute memory holds the attribute informations of the card such as the type of card, bit configuration, speed and so on.

## EEPROM Model

Card has 2k bytes of EEPROM attribute memory. To read the attribute memory, set REG="LOW" and perform a read with the same access timing as common memory read. For this operation, access time is 300ns maximum. To allow 2k bytes of attribute memory, even addresses from 0 to 4096 are reserved. Since only the even-numbered bytes are used, reading odd-numbered bytes will result in invalid data.

Note) We have another type of attribute memory as follows.

No EEPROM Model. (Model no. ID244K02: 5 bytes device informations in even address 0 to 8, read only in card's control circuit, with the same access timing as common memory read)

## Notes:

- 1) When the write protect switch is in protect-mode, the WP output signal is "HIGH" and write operations (including attribute memory) are not allowed.
- 2) A0-A11 are attribute memory addresses. Addresses after A12 are not decoded, so care should be taken.

## 15. Specification Changes

Specifications may be changed upon discussion and agreement between both parties.

## 16. Othes Precautions

- Permanent damage occurs if the memory card is stressed beyond Absolute Maximum Ratings. Operation beyond the Recommended Operating Conditions is not recommended and extended exposure beyond the Recommended Operating Conditions may affect device reliability.
- Writing to the memory card can be prevented by switching on the write protect switch on the end of the memory card.
- Avoid allowing the memory card connectors to come in contact with metals and avoid touching the connectors, as the internal circuits can be damaged by static electricity.
- Avoid storing in direct sunlight, high temperatures (do not place near heaters or radiators), high humidity and dusty areas.
- Avoid subjecting the memory card to strong physical abuse. Dropping, bending, smashing or throwing the card can result in loss of function.
- When the memory card is not being used, return it to its protective case.
- Do not allow the memory card to come in contact with fire.

## Packing Specification

1. Label the Model No. and Manufacturing No. on the back panel of the card.
2. Each memory card is contained in the flexible plastic case. (The front side of the card comes to the place where the card is released and the connector is attached against to this point, so that the connector is not touched by finger, as shown in the figure.)
3. The inner carton contains 25 pieces of the card with the case. (Note 1.)
4. The product name, lot no. (product no.), quantity and the date are either written directly on the inner carton, or printed on the label which is then attached on inner carton.
5. The outer carton contains 4 inner cartons. (Note 2.)
6. The product name, lot no. (product no.), quantity and the date are either written directly on the outer carton, or printed on the label which is then attached on the outer carton.
7. The outer carton is then put in the outer case, which contains 4 outer cartons. (Note 3.)
8. The product name, lot no. (product no.), quantity and the date are either written directly on the case or printed on the label which is then attached on the case.

Parts List	
Parts Name	
A	Flexible Plastic Case
B	Inner Carton (25 pieces contained)
C	Outer Carton (100 pieces contained)
D	Outer Case (400 pieces contained)

1. The least packing unit is 25 pieces, which is the number contained in the inner carton.
2. The space inside the outer carton is filled card board.
3. The other size of outer case may be used if there is not enough quantity to fill the normal outer case which can contain 4 outer cartons.
4. Size of label and generations are following. (Unit:mm)
