

STP16DP05

Low voltage 16-bit constant current LED sink driver with outputs error detection

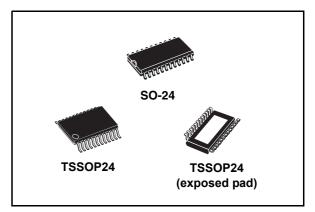

Features

- Low voltage power supply down to 3V
- 16 constant current output channels
- Adjustable output current through external resistor
- Short and open output error detection
- Serial Data IN/Parallel data OUT
- 3.3V micro driver-able
- Output current: 5-100mA
- 30MHz clock frequency
- Available in high thermal efficiency TSSOP exposed pad
- ESD protection 2.5kV HBM, 200V MM

Description

The STP16DP05 is a monolithic, low voltage, low current power 16-bit shift register designed for LED panel displays. The device contains a 16-bit serial-in, parallel-out shift register that feeds a 16bitD-type storage register. In the output stage, sixteen regulated current sources were designed to provide 5-100mA constant current to drive the LEDs.

The STP16DP05 features open and short LED detections on the outputs. The STP16DP05 is backward compatible with STP16C/L596. The detection circuit checks 3 different conditions that can occur on the output line: short to GND, short to V_O or open line.

The data detection results are loaded in the shift register and shifted out via the serial line output.

The detection functionality is implemented without increasing the pin count number, through a secondary function of the output enable and latch pin (DM1 and DM2 respectively), a dedicated logic sequence allows the device to enter or leave from detection mode. Through an external resistor, users can adjust the STP16DP05 output current, controlling in this way the light intensity of LEDs, in addition, user can adjust LED's brightness intensity from 0% to 100% via OE/DM2 pin.

The STP16DP05 guarantees a 20V output driving capability, allowing users to connect more LEDs in series. The high clock frequency, 30MHz, makes the device suitable for high data rate transmission. The 3.3V voltage supply is well useful for applications that interface any 3.3V micro. Compared with a standard TSSOP package, the TSSOP exposed pad increases heat dissipation capability by a 2.5 factor.

Table 1.Device summary

Order codes	Package	Packaging	
STP16DP05MTR	SO-24 (Tape & reel)	1000 parts per reel	
STP16DP05TTR	TSSOP24 (Tape & reel)	2500 parts per reel	
STP16DP05XTTR	TSSOP24 Exposed pad (Tape & reel)	2500 parts per reel

2 Electrical ratings

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the "Absolute Maximum Ratings" table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Symbol	Parameter	Value	Unit
V _{DD}	Supply voltage	0 to 7	V
Vo	Output voltage	-0.5 to 20	V
Ι _Ο	Output current	100	mA
VI	Input voltage	-0.4 to V _{DD}	V
I _{GND}	GND terminal current	1600	mA
f _{CLK}	Clock frequency	50	MHz

Note:

OUTn = ON when Dn = H OUTn = OFF when Dn = L

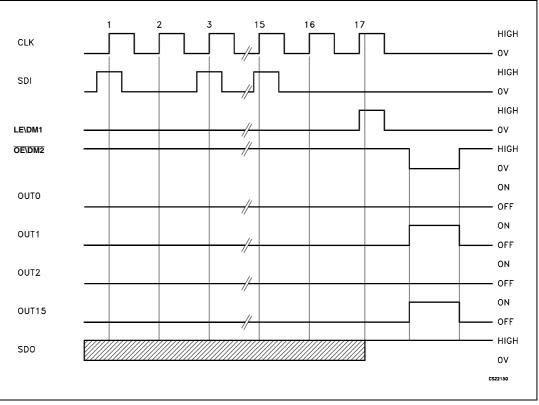

Figure 7. Timing diagram

Note:

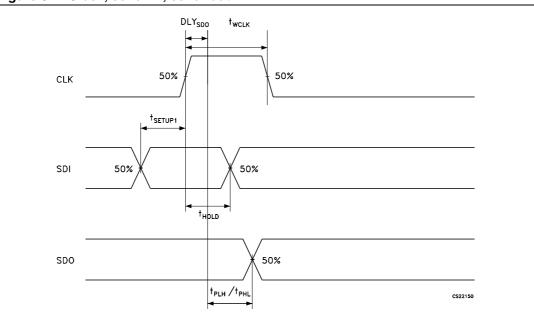

The latches circuit holds data when the LE\DM1 terminal is Low.

- 1 When LE\DM1 terminal is at High level, latch circuit hold the data it passes from the input to the output.
- 2 When OE\DM2 terminal is at Low level, output terminals OUT0 to OUT15 respond to the data, either ON or OFF.
- 3 When OE\DM2 terminal is at High level, it switches off all the data on the output terminal.

The Exposed-Pad should be soldered to the PBC to realize the thermal benefits.

7 Detection mode functionality

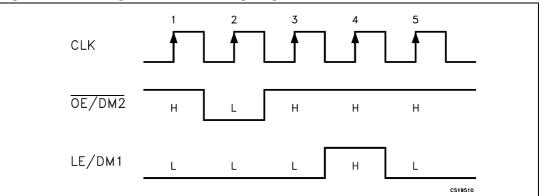

7.1 Phase one: "entering in detection mode"

From the "Normal Mode" condition the device can switch to the "Error Mode" by a logic sequence on the $\overline{OE \mid DM2}$ and LE/DM1 pins as showed in the following table and diagram:

CLK	1 °	2 °	3 °	4 °	5°			
OE/DM2	Н	L	Н	Н	Н			
LE/DM1	L	L	L	Н	L			

Table 12. Entering in detection truth table

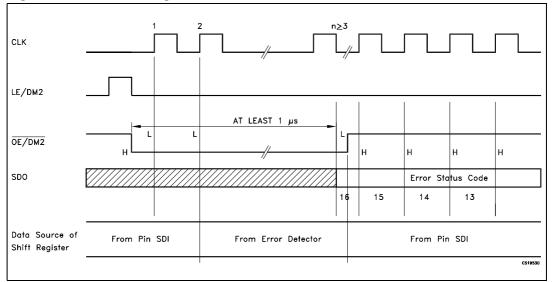

Figure 15. Entering in detection timing diagram

After these five CLK cycles the device goes into the "Error Detection Mode" and at the 6th rise front of CLK the SDI data are ready for the sampling.

7.2 Phase two: "error detection"

The 16 data bits must be set "1" in order to set ON all the outputs during the detection. The data are latched by LE/DM1 and after that the outputs are ready for the detection process. When the Micro controller switches the $\overline{OE \mid DM2}$ to LOW, the device drives the LEDs in order to analyze if an OPEN or SHORT condition has occurred.

The LEDs status will be detected at least in 1 microsecond and after this time the microcontroller sets \overline{OE} in HIGH state and the output data detection result will go to the microprocessor via SDO.

Detection mode and normal mode use both the same format data. As soon as all the detection data bits are available on the serial line, the device may go back to normal mode of operation. To re-detect the status the device must go back in normal mode and reentering in error detection mode .

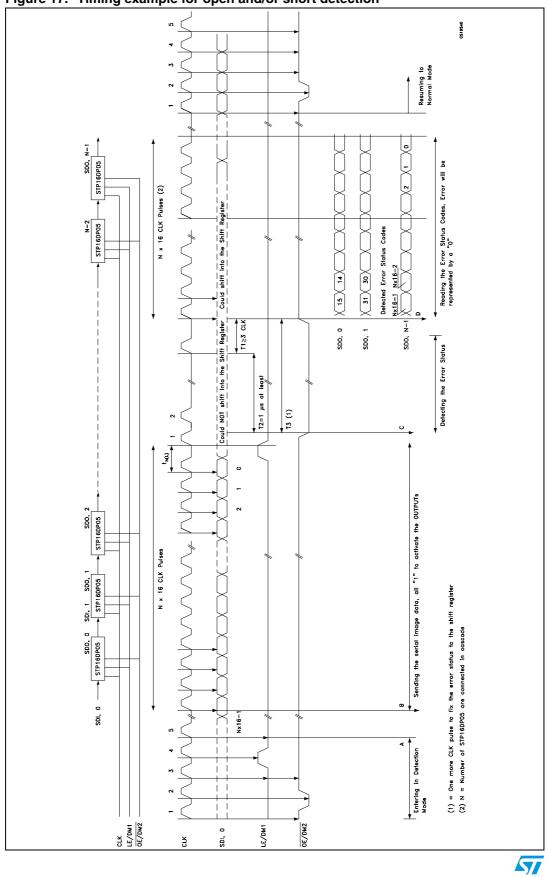

Figure 17. Timing example for open and/or short detection

7.3 Phase three: "resuming to normal mode"

The sequence for re-entering in normal mode is showed in the following Table and diagram:

CLK	1°	2 °	3°	4 °	5°
OE/DM2	Н	L	Н	Н	Н
LE/DM1	L	L	L	L	L

Figure 18. Resuming to normal mode timing diagram

Note:

For proper device operation the "Entering in detection" sequence must be follow by a "Resume Mode" sequence, it is not possible to insert consecutive equal sequence.

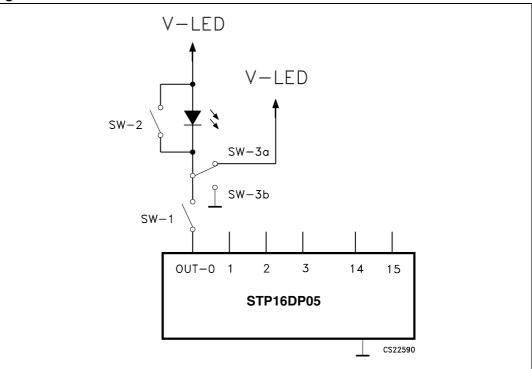

7.4 Error detection conditions

Table 13. Detection conditions (V_{DD} = 3.3 to 5 V temp. range -40 to 125°C)

Open line or output short to GND detected	==> $I_{ODEC} \le 0.5 \text{ x } I_O$	No error detected	==> $I_{ODEC} \ge 0.5 \text{ x } I_O$
Short on LED or short to V-LED detected	==> V _O ≥ 2.4 V	No error detected	==> $V_0 \le 2.2 V$

Note: Where: I_O = the output current programmed by the R_{EXT}, I_{ODEC} = the detected output current in detection mode

Figure 19. Detection circuit

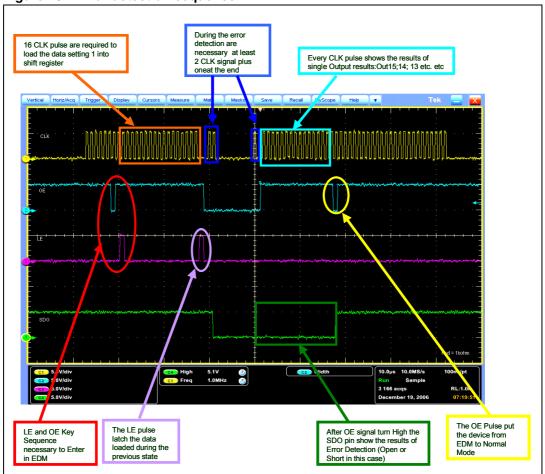

Figure 20. Error detection sequence

8 Package mechanical data

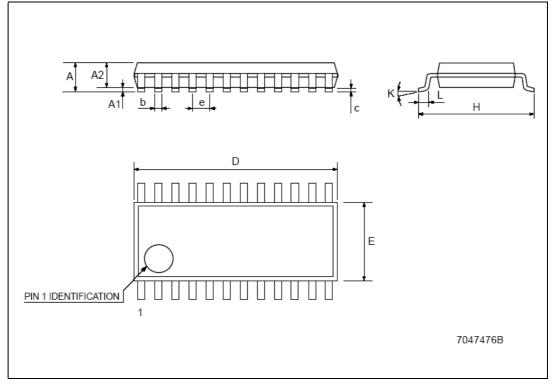

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com
