## LC87F2R04A — CMOS IC 4K-byte FROM and 128-byte RAM integrated 8-bit 1-chip Microcontroller

### Overview

The SANYO LC87F2R04A is an 8-bit microcomputer that, centered around a CPU running at a minimum bus cycle time of 83.3ns, integrates on a single chip a number of hardware features such as 4K-byte flash ROM, 128-byte RAM, an On-chip-debugger, sophisticated 16-bit timers/counters (may be divided into 8-bit timers), two 8-bit timers with a prescaler, an asynchronous/synchronous SIO interface, a 12-bit/8-bit 8-channel AD converter, an internal reset and a 12-source 8-vector interrupt feature.

### Features

#### ■Flash ROM

- Capable of on-board programming with wide range (2.2 to 5.5V) of voltage source.
- Block-erasable in 128 byte units
- Writable in 2-byte units
- 4096 × 8 bits

#### ■RAM

- 128 × 9 bits

#### ■Minimum Bus Cycle

- 83.3ns (12MHz at  $V_{DD}=2.7V$  to 5.5V)
- 100ns (10MHz at  $V_{DD}=2.2V$  to 5.5V)

Note: The bus cycle time here refers to the ROM read speed.

\* This product is licensed from Silicon Storage Technology, Inc. (USA), and manufactured and sold by SANYO Semiconductor Co., Ltd.

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

# LC87F2R04A

---

## ■ Minimum Instruction Cycle Time

- 250ns (12MHz at  $V_{DD}=2.7V$  to 5.5V)
- 300ns (10MHz at  $V_{DD}=2.2V$  to 5.5V)

## ■ Ports

- Normal withstand voltage I/O ports
  - Ports whose I/O direction can be designated in 1-bit units 11 (P1n, P20, P21, P70)
  - Ports whose I/O direction can be designated in 4-bit units 8 (P0n)
- Dedicated oscillator ports/input ports 2 (CF1, CF2)
- Reset pin 1 (RES)
- Power pins 2 ( $V_{SS1}$ ,  $V_{DD1}$ )

## ■ Timers

- Timer 0: 16-bit timer/counter with a capture register.
  - Mode 0: 8-bit timer with an 8-bit programmable prescaler (with an 8-bit capture register)  $\times$  2 channels
  - Mode 1: 8-bit timer with an 8-bit programmable prescaler (with an 8-bit capture register) + 8-bit counter (with an 8-bit capture register)
  - Mode 2: 16-bit timer with an 8-bit programmable prescaler (with a 16-bit capture register)
  - Mode 3: 16-bit counter (with a 16-bit capture register)
- Timer 6: 8-bit timer with a 6-bit prescaler (with toggle outputs)
- Timer 7: 8-bit timer with a 6-bit prescaler (with toggle outputs)

## ■ SIO

- SIO1: 8-bit asynchronous/synchronous serial interface
  - Mode 0: Synchronous 8-bit serial I/O (2- or 3-wire configuration, 2 to 512 tCYC transfer clocks)
  - Mode 1: Asynchronous serial I/O (half-duplex, 8 data bits, 1 stop bit, 8 to 2048 tCYC baudrates)
  - Mode 2: Bus mode 1 (start bit, 8 data bits, 2 to 512 tCYC transfer clocks)
  - Mode 3: Bus mode 2 (start detect, 8 data bits, stop detect)

## ■ AD Converter: 12 bits/8 bits $\times$ 8 channels

- 12/8 bits AD converter resolution selectable

## ■ Remote Control Receiver Circuit (sharing pins with P73, INT3, and T0IN)

- Noise rejection function (noise filter time constant selectable from 1 tCYC/32 tCYC/128 tCYC)

## ■ Watchdog Timer

- External RC watchdog timer
- Interrupt and reset signals selectable

# LC87F2R04A

## ■ Interrupts

- 12 sources, 8 vector addresses
  - 1) Provides three levels (low (L), high (H), and highest (X)) of multiplex interrupt control. Any interrupt requests of the level equal to or lower than the current interrupt are not accepted.
  - 2) When interrupt requests to two or more vector addresses occur at the same time, the interrupt of the highest level takes precedence over the other interrupts. For interrupts of the same level, the interrupt into the smallest vector address takes precedence.

No.	Vector Address	Level	Interrupt Source
1	00003H	X or L	INT0
2	0000BH	X or L	INT1
3	00013H	H or L	INT2/T0L/INT4
4	0001BH	H or L	INT3
5	00023H	H or L	T0H
6	0002BH	H or L	None
7	00033H	H or L	None
8	0003BH	H or L	SIO1
9	00043H	H or L	ADC/T6/T7
10	0004BH	H or L	Port 0

- Priority levels  $X > H > L$
- Of interrupts of the same level, the one with the smallest vector address takes precedence.

## ■ Subroutine Stack Levels: 64levels (The stack is allocated in RAM.)

## ■ High-speed Multiplication/Division Instructions

- 16 bits  $\times$  8 bits (5 tCYC execution time)
- 24 bits  $\times$  16 bits (12 tCYC execution time)
- 16 bits  $\div$  8 bits (8 tCYC execution time)
- 24 bits  $\div$  16 bits (12 tCYC execution time)

## ■ Oscillation Circuits

- Internal oscillation circuits
  - Medium-speed RC oscillation circuit: For system clock (1MHz)
  - Multifrequency RC oscillation circuit: For system clock (8MHz)
- External oscillation circuits
  - Hi-speed CF oscillation circuit: For system clock, with internal Rf

## ■ System Clock Divider Function

- Can run on low current.
- The minimum instruction cycle selectable from 300ns, 600ns, 1.2 $\mu$ s, 2.4 $\mu$ s, 4.8 $\mu$ s, 9.6 $\mu$ s, 19.2 $\mu$ s, 38.4 $\mu$ s, and 76.8 $\mu$ s (at a main clock rate of 10MHz).

## ■ Internal reset function

- Power-on reset (POR) function
  - 1) POR reset is generated only at power-on time.
  - 2) The POR release level can be selected from 8 levels (1.67V, 1.97V, 2.07V, 2.37V, 2.57V, 2.87V, 3.86V, and 4.35V) through option configuration.
- Low-voltage detection reset (LVD) function
  - 1) LVD and POR functions are combined to generate resets when power is turned on and when power voltage falls below a certain level.
  - 2) The use/disuse of the LVD function and the low voltage threshold level (7 levels: 1.91V, 2.01V, 2.31V, 2.51V, 2.81V, 3.79V, 4.28V).

# LC87F2R04A

---

## ■ Standby Function

- HALT mode: Halts instruction execution while allowing the peripheral circuits to continue operation.
  - 1) Oscillation is not halted automatically.
  - 2) There are three ways of resetting the HALT mode.
    - (1) Setting the reset pin to the low level
    - (2) System resetting by watchdog timer or low-voltage detection
    - (3) Occurrence of an interrupt
- HOLD mode: Suspends instruction execution and the operation of the peripheral circuits.
  - 1) The CF, RC and crystal oscillators automatically stop operation.
  - 2) There are four ways of resetting the HOLD mode.
    - (1) Setting the reset pin to the lower level.
    - (2) System resetting by watchdog timer or low-voltage detection
    - (3) Having an interrupt source established at either INT0, INT1, INT2, INT4
      - \* INT0 and INT1 HOLD mode reset is available only when level detection is set.
    - (4) Having an interrupt source established at port 0.

## ■ On-chip Debugger

- Supports software debugging with the IC mounted on the target board.
- Software break point setting for debugger.
- Stepwise execution on debugger.
- Real time RAM data monitoring function on debugger.

All the RAM data map can be monitored on screen when the program is running.  
(The RAM & SFR data can be changed by screen patch when the program is running)
- Two channels of on-chip debugger pins are available to be compatible with small pin count devices.  
DBGP0 (P0), DBGP1 (P1)

## ■ Data Security Function (flash versions only)

- Protects the program data stored in flash memory from unauthorized read or copy.

Note: This data security function does not necessarily provide absolute data security.

## ■ Package Form

- MFP24S(300mil): Lead-/Halogen-free type
- SSOP24(225mil): Lead-/Halogen-free type

## ■ Development Tools

- On-chip debugger: TCB87 TypeB+LC87F2R04A  
: TCB87 TypeC (3 wire version) +LC87F2R04A

# LC87F2R04A

## Port Output Types

The table below lists the types of port outputs and the presence/absence of a pull-up resistor. Data can be read into any input port even if it is in the output mode.

Port Name	Option selected in units of	Option type	Output type	Pull-up resistor
P00 to P07	1 bit	1	CMOS	Programmable (Note 1)
		2	Nch-open drain	No
P10 to P17	1 bit	1	CMOS	Programmable
		2	Nch-open drain	Programmable
P20 to P21	1 bit	1	CMOS	Programmable
		2	Nch-open drain	Programmable
P70	-	No	Nch-open drain	Programmable

Note 1: The control of the presence or absence of the programmable pull-up resistors for port 0 and the switching between low-and high-impedance pull-up connection is exercised in nibble (4-bit) units (P00 to 03 or P04 to 07).

## User Option Table

Option Name	Option Type	Mask version *1	Flash Version	Option Selected in Units of	Option Selection
Port output type	P00 to P07	○	○	1 bit	CMOS
					Nch-open drain
	P10 to P17	○	○	1 bit	CMOS
					Nch-open drain
P20 to P21	○	○	1 bit	CMOS	
				Nch-open drain	
Program start address	-	x *2	○	-	00000h
					01E00h
Low-voltage detection reset function	Detect function	○	○	-	Enable: Use
					Disable: Not Used
Power-on reset function	Power-On reset level	○	○	-	7-level
					8-level

\*1: Mask option selection-No change possible after mask is completed.

\*2: Program start address of the mask version is 00000h.

## Recommended Unused Pin Connections

Port Name	Recommended Unused Pin Connections	
	Board	Software
P00 to P07	Open	Output low
P10 to P17	Open	Output low
P20 to P21	Open	Output low
P70	Open	Output low
CF1	Pulled low with a 100kΩ resistor or less	General-purpose input port
CF2	Pulled low with a 100kΩ resistor or less	General-purpose input port

## On-chip Debugger Pin Connection Requirements

For the treatment of the on-chip debugger pins, refer to the separately available documents entitled "RD87 on-chip debugger installation manual" and "LC872000 series on-chip debugger pin connection requirements"

## Notes on CF1 and CF2 Pins

- When using as general-purpose input ports

Since the CF1 and CF2 pins are configured as CF oscillator pins at system reset time, it is necessary to add a current limiting resistor of 1kΩ or greater to the CF2 pin in series when using them as general-purpose input pins.

# LC87F2R04A

## Differences between LC872G00 and LC872R00 Series.

		System Reset Time State	After System Reset is Released
Flash ROM version LC87F2G08A	CF1/XT1	Set high via the internal Rf resistor	CF oscillation state
	CF2/XT2	Set high	CF oscillation state
Mask ROM version LC872G08A	CF1/XT1	Set low via the internal Rf resistor	CF oscillation state
	CF2/XT2	Set low	CF oscillation state
Flash ROM version LC87F2R04A	CF1	Set low via the internal Rf resistor	CF oscillation state
Mask ROM version LC872R04A	CF2	High-impedance (OPEN)	CF oscillation state

## Power Pin Treatment Recommendations ( $V_{DD1}$ , $V_{SS1}$ )

Connect bypass capacitors that meet the following conditions between the  $V_{DD1}$  and  $V_{SS1}$  pins:

- Connect among the  $V_{DD1}$  and  $V_{SS1}$  pins and bypass capacitors C1 and C2 with the shortest possible heavy lead wires, making sure that the impedances between the both pins and the bypass capacitors are as possible ( $L1=L1'$ ,  $L2=L2'$ ).
- Connect a large-capacity capacitor C1 and a small-capacity capacitor C2 in parallel. The capacitance of C2 should be approximately 0.1 $\mu$ F.

# LC87F2R04A

## Absolute Maximum Ratings at Ta = 25°C, VSS1 = 0V

Parameter	Symbol	Pin/Remarks	Conditions	Specification				unit	
				V <sub>DD</sub> [V]	min	typ	max		
Maximum supply voltage	V <sub>DD</sub> max	V <sub>DD</sub> 1			-0.3		+6.5	V

				2.2 to 5.5	0.294		200	
External system clock frequency	FEXCF	CF1	<ul style="list-style-type: none"> <li>• CF2 pin open</li> <li>• System clock frequency division ratio=1/1</li> <li>• External system clock duty=50±5%</li> </ul>	2.7 to 5.5	0.1		12	MHz
			<ul style="list-style-type: none"> <li>• CF2 pin open</li> <li>• System clock frequency division ratio=1/2</li> <li>• External system clock duty=50±5%</li> </ul>	2.2 to 5.5	0.1		10	
			<ul style="list-style-type: none"> <li>• CF2 pin open</li> <li>• System clock frequency division ratio=1/2</li> <li>• External system clock duty=50±5%</li> </ul>	3.0 to 5.5	0.2		24.4	
Oscillation frequency range (Note 2-3)	FmCF(1)	CF1, CF2	12MHz ceramic oscillation See Fig. 1.	2.7 to 5.5		12		MHz
	FmCF(2)	CF1, CF2	10MHz ceramic oscillation See Fig. 1.	2.2 to 5.5		10		
	FmCF(3)	CF1, CF2	4MHz ceramic oscillation. CF oscillation normal amplifier size selected. (CFLAMP=0) See Fig. 1	2.2 to 5.5		4		
			4MHz ceramic oscillation. CF oscillation low amplifier size selected. (CFLAMP=1) See Fig. 1.	2.2 to 5.5		4		
	FmMRC		Frequency variable RC oscillation. 1/2 frequency division ration. (RCCTD=0) (Note 2-4)	2.7 to 5.5	7.6	8.0	8.4	
	FmRC		Internal medium-speed RC oscillation	2.2 to 5.5	0.5	1.0	2.0	

Note 2-1: VDD must be held greater than or equal to 2.2V in the flash ROM onboard programming mode.

Note 2-2: Relationship between tCYC and oscillation frequency is 3/FmCF at a division ratio of 1/1 and 6/FmCF at a division ratio of 1/2.

Note 2-3: See Tables 1 and 2 for the oscillation constants.

Note 2-4: When switching the system clock, allow an oscillation stabilization time of 100μs or longer after the multifrequency RC oscillator circuit transmits from the "oscillation stopped" to "oscillation enabled" state.

## AD Converter Characteristics at Ta = -40°C to +85°C, VSS1 = 0V

### 12bits AD Converter Mode

Parameter	Symbol	Pin/Remarks	Conditions	Specification					
				V <sub>DD</sub> [V]	min	typ	max	unit	
Resolution	N	AN0(P00) to AN6(P06), AN8(P70)		2.4 to 5.5		12		bit	
Absolute accuracy	ET		(Note 6-1)		2.7 to 5.5			±16	LSB
					2.4 to 5.5			±20	
Conversion time	TCAD		• See Conversion time calculation formulas. (Note 6-2)		4.0 to 5.5	32		115	μs
					2.7 to 5.5	64		115	
					2.4 to 5.5	410		425	
Analog input voltage range	VAIN			2.4 to 5.5	V <sub>SS</sub>		V <sub>DD</sub>	V	
Analog port input current	I <sub>AINH</sub>		V <sub>AIN</sub> =V <sub>DD</sub>	2.4 to 5.5			1	μA	
	I <sub>AINL</sub>		V <sub>AIN</sub> =V <sub>SS</sub>	2.4 to 5.5	-1				

### 8bits AD Converter Mode

Parameter	Symbol	Pin/Remarks	Conditions	Specification					
				V <sub>DD</sub> [V]	min	typ	max	unit	
Resolution	N	AN0(P00) to AN6(P06) AN8(P70)		2.4 to 5.5		8		bit	
Absolute accuracy	ET		(Note 6-1)		2.4 to 5.5			±1.5	LSB
					2.4 to 5.5				
Conversion time	TCAD		• See Conversion time calculation formulas. (Note 6-2)		4.0 to 5.5	20		90	μs
					2.7 to 5.5	40		90	
					2.4 to 5.5	250		265	
Analog input voltage range	VAIN			2.4 to 5.5	V <sub>SS</sub>		V <sub>DD</sub>	V	
Analog port input current	I <sub>AINH</sub>		V <sub>AIN</sub> =V <sub>DD</sub>	2.4 to 5.5			1	μA	
	I <sub>AINL</sub>		V <sub>AIN</sub> =V <sub>SS</sub>	2.4 to 5.5	-1				

Conversion time calculation formulas:

$$12\text{bits AD Converter Mode: TCAD(Conversion time)} = ((52/(\text{AD division ratio}))+2) \times (1/3) \times \text{tCYC}$$

$$8\text{bits AD Converter Mode: TCAD(Conversion time)} = ((32/(\text{AD division ratio}))+2) \times (1/3) \times \text{tCYC}$$

External oscillation (FmCF)	Operating supply voltage range (V <sub>DD</sub> )	System division ratio (SYS DIV)	Cycle time (tCYC)	AD division ratio (ADDIV)	AD conversion time (TCAD)	
					12bit AD	8bit AD
CF-12MHz	4.0V to 5.5V	1/1	250ns	1/8	34.8μs	21.5μs
	3.0V to 5.5V	1/1	250ns	1/16	69.5μs	42.8μs
CF-10MHz	4.0V to 5.5V	1/1	300ns	1/8	41.8μs	25.8μs
	3.0V to 5.5V	1/1	300ns	1/16	83.4μs	51.4μs
CF-4MHz	3.0V to 5.5V	1/1	750ns	1/8	104.5μs	64.5μs
	2.4V to 5.5V	1/1	750ns	1/32	416.5μs	256.5μs

Note 6-1: The quantization error (±1/2LSB) must be excluded from the absolute accuracy. The absolute accuracy must be measured in the microcontroller's state in which no I/O operations occur at the pins adjacent to the analog input channel.

Note 6-2: The conversion time refers to the period from the time an instruction for starting a conversion process till the time the conversion results register(s) are loaded with a complete digital conversion value corresponding to the analog input value.

The conversion time is 2 times the normal-time conversion time when:

- The first AD conversion is performed in the 12-bit AD conversion mode after a system reset.
- The first AD conversion is performed after the AD conversion mode is switched from 8-bit to 12-bit conversion mode.

## LC87F2R04A

### Power-on Reset (POR) Characteristics at Ta = -40°C to +85°C, V<sub>SS1</sub> = 0V

Parameter	Symbol	Pin/Remarks	Conditions	Specification				
				Option selected voltage	min	typ	max	unit
POR release voltage	PORRL		<ul style="list-style-type: none"> <li>Select from option. (Note 7-1)</li> </ul>	1.67V	1.55	1.67	1.79	V

The oscillation stabilization time refers to the time interval that is required for the oscillation to get stabilized after V<sub>DD</sub> goes above the operating voltage lower limit (see Figure 3).

- Time till the oscillation gets stabilized after the CPU reset state is released.
- Till the oscillation gets stabilized after the instruction for starting the main clock oscillation circuit is executed.
- Till the oscillation gets stabilized after the HOLD mode is reset.

(Notes on the implementation of the oscillator circuit)

- Oscillation is influenced by the circuit pattern layout of printed circuit board. Place the oscillation-related components as close to the CPU chip and to each other as possible with the shortest possible pattern length.
- Keep the signal lines whose state changes suddenly or in which large current flows as far away from the oscillator circuit as possible and make sure that they do not cross one another.
- Be sure to insert a current limiting resistor (R<sub>d</sub>) so that the oscillation amplitude never exceeds the input voltage level that is specified as the absolute maximum rating.
- The oscillator circuit constants shown above are sample characteristic values that are measured using the SANYO-designated oscillation evaluation board. Since the accuracy of the oscillation frequency and other characteristics vary according to the board on which the IC is installed, it is recommended that the user consult the resonator vendor for oscillation evaluation of the IC on a user's production board when using the IC for applications that require high oscillation accuracy. For further information, contact your resonator vendor or SANYO Semiconductor sales representative serving your locality.
- It must be noted, when replacing the flash ROM version of a microcontroller with a mask ROM version, that their operating voltage ranges may differ even when the oscillation constant of the external oscillator is the same.

# LC87F2R04A

Note:  
External circuits for reset may vary depending on the usage of POR and LVD. Please refer to the user's manual for more information..

Figure 4 Reset Circuit

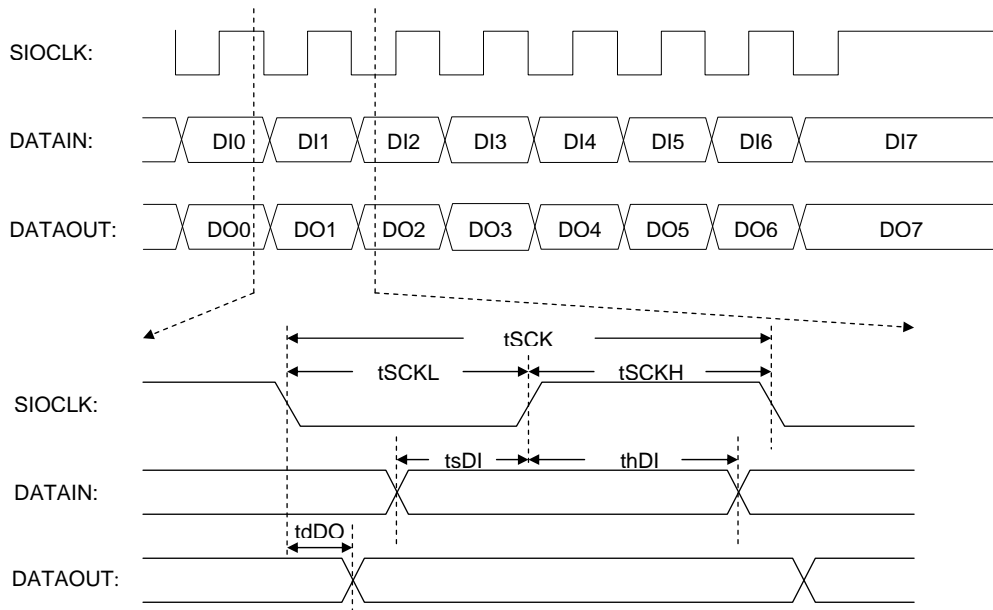

Figure 5 Serial I/O Output Waveforms

Figure 6 Pulse Input Timing Signal Waveform

Figure 7 Waveform observed when only POR is used (LVD not used)  
(RESET pin: Pull-up resistor  $R_{RES}$  only)

- The POR function generates a reset only when power is turned on starting at the  $V_{SS}$  level.
- No stable reset will be generated if power is turned on again when the power level does not go down to the  $V_{SS}$  level as shown in (a). If such a case is anticipated, use the LVD function together with the POR function or implement an external reset circuit.
- A reset is generated only when the power level goes down to the  $V_{SS}$  level as shown in (b) and power is turned on again after this condition continues for  $100\mu s$  or longer.

Figure 8 Waveform observed when both POR and LVD functions are used  
(RESET pin: Pull-up resistor  $R_{RES}$  only)

- Resets are generated both when power is turned on and when the power level lowers.
- A hysteresis width (LVHYS) is provided to prevent the repetitions of reset release and entry cycles near the detection level.

(Example of momentary power loss / Voltage variation waveform)

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
- SANYO Semiconductor Co.,Ltd. strives to supply high-quality high-reliability products, however, any and all semiconductor products fail or malfunction with some probability. It is possible that these probabilistic failures or malfunction could give rise to accidents or events that could endanger human lives, trouble that could give rise to smoke or fire, or accidents that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO Semiconductor Co.,Ltd. products described or contained herein are controlled under any of applicable local export control laws and regulations, such products may require the export license from the authorities concerned in accordance with the above law.
- No part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying and recording, or any information storage or retrieval system, or otherwise, without the prior written consent of SANYO Semiconductor Co.,Ltd.
- Any and all information described or contained herein are subject to change without notice due to product/technology improvement, etc. When designing equipment, refer to the "Delivery Specification" for the SANYO Semiconductor Co.,Ltd. product that you intend to use.
- Information (including circuit diagrams and circuit parameters) herein is for example only; it is not guaranteed for volume production.
- Upon using the technical information or products described herein, neither warranty nor license shall be granted with regard to intellectual property rights or any other rights of SANYO Semiconductor Co.,Ltd. or any third party. SANYO Semiconductor Co.,Ltd. shall not be liable for any claim or suits with regard to a third party's intellectual property rights which has resulted from the use of the technical information and products mentioned above.
