GENERAL DESCRIPTION

The XRT86VX38 is an eight-channel 1.544 Mbit/s or 2.048 Mbit/s DS1/E1/J1 framer and Long-haul/Short-hual LIU integrated solution featuring R^3 technology (Relayless, Reconfigurable, Redundancy) and BITS Timing element. The physical interface is optimized with internal impedance, and with the patented pad structure, the XRT86VX38 provides protection from power failures and hot swapping.

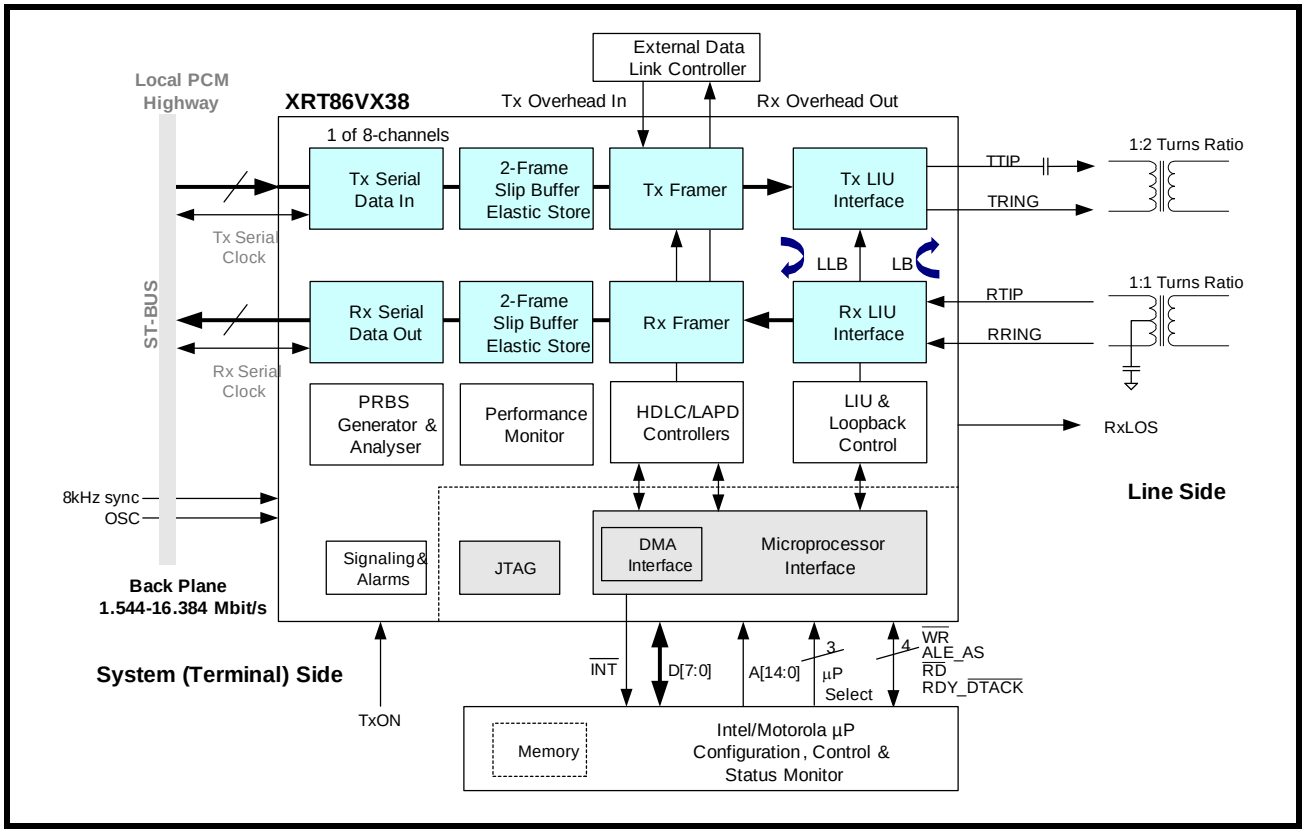
The XRT86VX38 contains an integrated DS1/E1/J1 framer and LIU which provide DS1/E1/J1 framing and error accumulation in accordance with ANSI/ITU_T specifications. Each framer has its own framing synchronizer and transmit-receive slip buffers. The slip buffers can be independently enabled or disabled as required and can be configured to frame to the common DS1/E1/J1 signal formats.

Each Framer block contains its own Transmit and Receive T1/E1/J1 Framing function. There are 3 Transmit HDLC controllers per channel which encapsulate contents of the Transmit HDLC buffers into LAPD Message frames. There are 3 Receive HDLC controllers per channel which extract the payload content of Receive LAPD Message frames from the incoming T1/E1/J1 data stream and write the contents into the Receive HDLC buffers. Each framer also contains a Transmit and Overhead Data Input port, which permits Data Link Terminal Equipment direct access to the outbound T1/E1/J1 frames. Likewise, a Receive Overhead output data port permits Data Link Terminal Equipment direct access to the Data Link bits of the inbound T1/E1/J1 frames.

The XRT86VX38 fully meets all of the latest T1/E1/J1 specifications: ANSI T1/E1.107-1988, ANSI T1/E1.403-1995, ANSI T1/E1.231-1993, ANSI T1/E1.408-1990, AT&T TR 62411 (12-90) TR54016, and ITU G-703, G.704, G706 and G.733, AT&T Pub. 43801, and ETS 300 011, 300 233, JT G.703, JT G.704, JT G706, I.431. Extensive test and diagnostic functions include Loop-backs, Boundary scan, Pseudo Random bit sequence (PRBS) test pattern generation, Performance Monitor, Bit Error Rate (BER) meter, forced error insertion, and LAPD unchannelized data payload processing according to ITU-T standard Q.921.

Applications and Features (next page)

FIGURE 1. XRT86VX38 8-CHANNEL DS1 (T1/E1/J1) FRAMER/LIU COMBO



APPLICATIONS

- High-Density T1/E1/J1 interfaces for Multiplexers, Switches, LAN Routers and Digital Modems
- SONET/SDH terminal or Add/Drop multiplexers (ADMs)
- T1/E1/J1 add/drop multiplexers (MUX)
- Channel Service Units (CSUs): T1/E1/J1 and Fractional T1/E1/J1
- BITS Timing
- Digital Access Cross-connect System (DACs)
- Digital Cross-connect Systems (DCS)
- Frame Relay Switches and Access Devices (FRADS)
- ISDN Primary Rate Interfaces (PRA)
- PBXs and PCM channel bank
- T3 channelized access concentrators and M13 MUX
- Wireless base stations
- ATM equipment with integrated DS1 interfaces
- Multichannel DS1 Test Equipment
- T1/E1/J1 Performance Monitoring
- Voice over packet gateways
- Routers

FEATURES

- Supports Section 13 - Synchronization Interface in ITU G.703 for both Transmit and Receive Paths
- Supports SSM Synchronous Messaging Generation (BOC for T1, National Bits for E1) on the Transmit Path
- Supports SSM Synchronous Messaging Extraction (BOC for T1, National Bits for E1) on the Receive Path
- Supports BITS timing generation on the Transmit Outputs
- Supports BITS timing extraction from NRZ data on the Analog Receive Path
- DS-0 Monitoring on both Transmit and Receive Time Slots
- Supports SSM Synchronization Messaging per ANSI T1.101-1999 and ITU G.704
- Supports a Customized Section 13 - Synchronization Interface in G.703 at 1.544MHz
- Independent, full duplex DS1 Tx and Rx Framer/LIUs
- Each channel has full featured Long-haul/Short-haul LIU
- Two 512-bit (two-frame) elastic store, PCM frame slip buffers (FIFO) on TX and Rx provide up to 8.192 MHz asynchronous back plane connections with jitter and wander attenuation
- Supports input PCM and signaling data at 1.544, 2.048, 4.096 and 8.192 Mbits. Also supports 2-channel multiplexed 12.352/16.384 (HMVIP/H.100) Mbit/s on the back plane bus
- Programmable output clocks for Fractional T1/E1/J1
- Supports Channel Associated Signaling (CAS)
- Supports Common Channel Signalling (CCS)
- Supports ISDN Primary Rate Interface (ISDN PRI) signaling

- Extracts and inserts robbed bit signaling (RBS)
- 3 Integrated HDLC controllers for transmit and receive, each controller having two 96-byte buffers (buffer 0 / buffer 1)
- HDLC Controllers Support SS7
- Timeslot assignable HDLC
- V5.1 or V5.2 Interface
- Automatic Performance Report Generation (PMON Status) can be inserted into the transmit LAPD interface every 1 second or for a single transmission
- Supports SPRM and NPRM
- Alarm Indication Signal with Customer Installation signature (AIS-CI)
- Remote Alarm Indication with Customer Installation (RAI-CI)
- Gapped Clock interface mode for Transmit and Receive.
- Intel/Motorola and Power PC interfaces for configuration, control and status monitoring
- Parallel search algorithm for fast frame synchronization
- Wide choice of T1 framing structures: SF/D4, ESF, SLC®96, T1DM and N-Frame (non-signaling)
- Direct access to D and E channels for fast transmission of data link information
- Full BERT Controller for generation and detection on system and line side of the chip
- PRBS, QRSS, and Network Loop Code generation and detection
- Seven Independent, simultaneous Loop Code Detectors per Channel
- Programmable Interrupt output pin
- Supports programmed I/O and DMA modes of Read-Write access
- The framer block encodes and decodes the T1/E1/J1 Frame serial data
- Detects and forces Red (SAI), Yellow (RAI) and Blue (AIS) Alarms
- Detects OOF, LOF, LOS errors and COFA conditions
- Loopbacks: Local (LLB) and Line remote (LB)
- Facilitates Inverse Multiplexing for ATM
- Performance monitor with one second polling
- Boundary scan (IEEE 1149.1) JTAG test port
- Accepts external 8kHz Sync reference
- 1.8V Inner Core
- 3.3V CMOS operation with 5V tolerant inputs
- 256-pin fpBGA and 329-pin fpBGA package with -40°C to +85°C operation

2.0 PIN DESCRIPTIONS

There are six types of pins defined throughout this pin description and the corresponding symbol is presented in table below. The per-channel pin is indicated by the channel number or the letter 'n' which is appended at the end of the signal name, for example, TxSERn, where "n" indicates channels 0 to 7. All output pins are "tri-stated" upon hardware RESET.

SYMBOL	PIN TYPE
I	Input
O	Output
I/O	Bidirectional
GND	Ground
PWR	Power
NC	No Connect

The structure of the pin description is divided into eleven groups, as presented in the table below

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxSER0/ TxPOS0 TxSER1/ TxPOS1 TxSER2/ TxPOS2 TxSER3/ TxPOS3 TxSER4/ TxPOS4 TxSER5/ TxPOS5 TxSER6/ TxPOS6 TxSER7/ TxPOS7	D11 A14 D17 F19 W17 V13 W9 W6	E10 C12 D14 F15 N12 P10 T8 P5	I	-	**Transmit Serial Data Input (TxSERn)/Transmit Positive Digital Input (TxPOSn):** The exact function of these pins depends on the mode of operation selected, as described below. **DS1/E1 Mode - TxSERn** These pins function as the transmit serial data input on the system side interface, which are latched on the rising edge of the TxSERCLKn pin. Any payload data applied to this pin will be inserted into an outbound DS1/E1 frame and output to the line. In DS1 mode, the framing alignment bits, facility data link bits, CRC-6 bits, and signaling information can also be inserted from this input pin if configured appropriately. In E1 mode, all data intended to be transported via Time Slots 1 through 15 and Time slots 17 through 31 must be applied to this input pin. Data intended for Time Slots 0 and 16 can also be applied to this input pin If configured accordingly. **DS1 or E1 High-Speed Multiplexed Mode* - TxSERn** In this mode, these pins are used as the high-speed multiplexed data input pin on the system side. High-speed multiplexed data of channels 0-3 must be applied to TxSER0 and high-speed multiplexed data of channels 4-7 must be applied to TxSER4 in a byte or bit-interleaved way. The framer latches in the multiplexed data on TxSER0 and TxSER4 using TxMSYNC/TxINCLK and demultiplexes this data into 4 serial streams. The LIU block will then output the data to the line interface using TxSERCLKn. **DS1 or E1 Framer Bypass Mode - TxPOSn** In this mode, TxSERn is used for the positive digital input pin (TxPOSn) to the LIU. ***NOTE:*** 1. **High-speed multiplexed modes include (For T1/E1) 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.* 2. *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).* 3. *These 8 pins are internally pulled "High" for each channel.*

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxSERCLK0/ TxLINECLK0 TxSERCLK1/ TxLINECLK1 TxSERCLK2/ TxLINECLK2 TxSERCLK3/ TxLINECLK3 TxSERCLK4/ TxLINECLK4 TxSERCLK5/ TxLINECLK5 TxSERCLK6/ TxLINECLK6 TxSERCLK7/ TxLINECLK7	B11 D14 C17 F18 V17 T11 W8 U5	D10 B13 B15 E16 T14 N10 T7 P6	I/O	12	**Transmit Serial Clock (TxSERCLKn)/Transmit Line Clock (TxSERCLKn):** The exact function of these pins depends on the mode of operation selected, as described below. **In Base-Rate Mode (1.544MHz/2.048MHz) - TxSERCLKn:** This clock signal is used by the transmit serial interface to latch the contents on the TxSERn pins into the T1/E1 framer on the rising edge of the TxSERCLKn. These pins can be configured as input or output as described below. **When TxSERCLKn is configured as Input:** These pins will be inputs if the TxSERCLK is chosen as the timing source for the transmit framer. Users must provide a 1.544MHz clock rate to this input pin for T1 mode of operation, and 2.048MHz clock rate in E1 mode. **When TxSERCLKn is configured as Output:** These pins will be outputs if either the recovered line clock or the MCLK PLL is chosen as the timing source for the T1/E1 transmit framer. The transmit framer will output a 1.544MHz clock rate in T1 mode of operation, and a 2.048MHz clock rate in E1 mode. **DS1/E1 High-Speed Backplane Modes* - TxSERCLKn as INPUT ONLY** In this mode, TxSERCLK is an optional clock signal input which is used as the timing source for the transmit line interface, and is only required if TxSERCLK is chosen as the timing source for the transmit framer. If TxSERCLK is chosen as the timing source, system equipment should provide 1.544MHz (For T1 mode) or 2.048MHz (For E1 mode) to the TxSERCLKn pins on each channel. TxSERCLK is not required if either the recovered clock or MCLK PLL is chosen as the timing source of the device. High speed or multiplexed data is latched into the device using the TxMSYNC/TxINCLK high-speed clock signal. **DS1 or E1 Framer Bypass Mode - TxLINECLKn** In this mode, TxSERCLKn is used as the transmit line clock (TxLINECLK) to the LIU. ***NOTE:*** **High-speed backplane modes include (For T1/E1) 2.048MVIP, 4.096MHz, 8.192MHz, 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.* ***NOTE:*** *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).* ***NOTE:*** *These 8 pins are internally pulled "High" for each channel.*

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxSYNC0/ TxNEG0 TxSYNC1/ TxNEG1 TxSYNC2/ TxNEG2 TxSYNC3/ TxNEG3 TxSYNC4/ TxNEG4 TxSYNC5/ TxNEG5 TxSYNC6/ TxNEG6 TxSYNC7/ TxNEG7	A9 A13 D16 E19 T16 U13 V9 W7	C9 B12 A14 E15 T13 M11 N8 T6	I/O	12	**Transmit Single Frame Sync Pulse (TxSYNCn) / Transmit Negative Digital Input (TxNEGn):** The exact function of these pins depends on the mode of operation selected, as described below. **DS1/E1 Base Rate Mode (1.544MHz/2.048MHz) - TxSYNCn:** These TxSYNCn pins are used to indicate the single frame boundary within an outbound T1/E1 frame. In both DS1 or E1 mode, the single frame boundary repeats every 125 microseconds (8kHz). In DS1/E1 base rate, TxSYNCn can be configured as either input or output as described below. **When TxSYNCn is configured as an Input**: Users must provide a signal which must pulse "High" for one period of TxSERCLK during the first bit of an outbound DS1/E1 frame. It is imperative that the TxSYNC input signal be synchronized with the TxSERCLK input signal. **When TxSYNCn is configured as an Output:** The transmit T1/E1 framer will output a signal which pulses "High" for one period of TxSERCLK during the first bit of an outbound DS1/E1 frame. **DS1/E1 High-Speed Backplane Modes* - TxSYNCn as INPUT ONLY:** In this mode, TxSYNCn must be an input regardless of the clock source that is chosen to be the timing source for the transmit framer. In 2.048MVIP/4.096/8.192MHz high-speed modes, TxSYNCn pins must be pulsed 'High' for one period of TxSERCLK during the first bit of the outbound T1/E1 frame. In HMVIP mode, TxSYNC0 and TxSYNC4 must be pulsed 'High' for 4 clock cycles of the TxMSYNC/TxINCLK signal in the position of the first two and the last two bits of a multiplexed frame. In H.100 mode, TxSYNC0 and TxSYNC4 must be pulsed 'High' for 2 clock cycles of the TxMSYNC/TxINCLK signal in the position of the first and the last bit of a multiplexed frame. **DS1 or E1 Framer Bypass Mode - TxNEGn** In this mode, TxSYNCn is used as the negative digital input pin (TxNEG) to the LIU. ***NOTE:*** **High-speed backplane modes include (For T1/E1) 2.048MVIP, 4.096MHz, 8.192MHz, 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.* ***NOTE:*** *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).* ***NOTE:*** *These 8 pins are internally pulled "Low" for each channel.*

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxMSYNC0/ TxINCLK0	B10	D9	I/O	12	**Multiframe Sync Pulse (TxMSYNCn) / Transmit Input Clock (TxINCLKn)** The exact function of these pins depends on the mode of operation selected, as described below. **DS1/E1 Base Rate Mode (1.544MHz/2.048MHz) - TxMSYNCn** In this mode, these pins are used to indicate the multi-frame boundary within an outbound DS1/E1 frame. In DS1 ESF mode, TxMSYNCn repeats every 3ms. In DS1 SF mode, TxMSYNCn repeats every 1.5ms. In E1 mode, TxMSYNCn repeats every 2ms. If TxMSYNCn is configured as an input, TxMSYNCn must pulse "High" for one period of TxSERCLK during the first bit of an outbound DS1/E1 multi-frame. It is imperative that the TxMSYNC input signal be synchronized with the TxSERCLK input signal. If TxMSYNCn is configured as an output, the transmit section of the T1/E1 framer will output and pulse TxMSYNC "High" for one period of TxSERCLK during the first bit of an outbound DS1/E1 frame. **DS1/E1 High-Speed Backplane Modes* - (TxINCLKn as INPUT ONLY)** In this mode, this pin must be used as the high-speed input clock pin (TxINCLKn) for the backplane interface to latch in high-speed or multiplexed data on the TxSERn pin. The frequency of TxINCLK is presented in the table below.
TxMSYNC1/ TxINCLK1	B14	A12			
TxMSYNC2/ TxINCLK2	C18	C15			
TxMSYNC3/ TxINCLK3	G16	E14			
TxMSYNC4/ TxINCLK4	U16	P13			
TxMSYNC5/ TxINCLK5	T13	R11			
TxMSYNC6/ TxINCLK6	R8	R8			
TxMSYNC7/ TxINCLK7	V6	N6			

OPERATION MODE	FREQUENCY OF TXINCLK(MHZ)
2.048MVIP non-multiplexed	2.048
4.096MHz non-multiplexed	4.096
8.192MHz non-multiplexed	8.192
12.352MHz Bit-multiplexed (DS1 ONLY)	12.352
16.384MHz Bit-multiplexed	16.384
16.384 HMVIP Byte-multiplexed	16.384
16.384 H.100 Byte-multiplexed	16.384

NOTES:

1. **High-speed backplane modes include (For T1/E1) 2.048MVIP, 4.096MHz, 8.192MHz, 16.384MHz HMVIP, H.100, Bit-multiplexed modes, and (For T1 only) 12.352MHz Bit-multiplexed mode.*
2. *In DS1 high-speed modes, the DS-0 data is mapped into an E1 frame by ignoring every fourth time slot (don't care).*
3. *These 8 pins are internally pulled "Low" for each channel.*

TRANSMIT SYSTEM SIDE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE(MA)	DESCRIPTION
TxSIG0 TxSIG1 TxSIG2 TxSIG3 TxSIG4 TxSIG5 TxSIG6 TxSIG7	A10 B15 B18 G18 V16 W13 U10 U6		I/O	8	**Transmit Time Slot Octet Identifier Output 0 (TxCHNn_0) / Transmit Serial Signaling Input (TxSIGn):** The exact function of these pins depends on whether or not the transmit framer enables the transmit fractional/signaling interface, as described below: **If transmit fractional/signaling interface is disabled -** - No function **If transmit fractional/signaling interface is enabled - TxSIGn:** These pins can be used to input robbed-bit signaling data to be inserted within an outbound DS1 frame or to input Channel Associated Signaling (CAS) data within an outbound E1 frame, as described below. **T1 Mode:** Signaling data (A,B,C,D) of each channel must be provided on bit 4,5,6,7 of each time slot on the TxSIG pin if 16-code signaling is used. If 4-code signaling is selected, signaling data (A,B) of each channel must be provided on bit 4, 5 of each time slot on the TxSIG pin. If 2-code signaling is selected, signaling data (A) of each channel must be provided on bit 4 of each time slot on the TxSIG pin. **E1 Mode:** Signaling data in E1 mode can be provided on the TxSIGn pins on a time-slot-basis as in T1 mode, or it can be provided on time slot 16 only via the TxSIGn input pins. In the latter case, signaling data (A,B,C,D) of channel 1 and channel 17 must be inserted on the TxSIGn pin during time slot 16 of frame 1, signaling data (A,B,C,D) of channel 2 and channel 18 must be inserted on the TxSIGn pin during time slot 16 of frame 2...etc. The CAS multiframe Alignments bits (0000 bits) and the extra bits/alarm bit (xyxx) must be inserted on the TxSIGn pin during time slot 16 of frame 0. ***NOTE:*** *Transmit fractional interface can be enabled by programming to bit 4 - TxFr1544/TxFr2048 bit from register 0xn120 to '1'.* ***NOTE:*** *These 8 pins are internally pulled "Low" for each channel.*

RECEIVE SYSTEM SIDE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION

If 2-code signaling is selected, signaling data (A) of each channel will be output on bit 4 of each time slot on the RxSIG pin. **E1 Mode:** Signaling data in E1 mode will be output on the RxSIGn pins on a time-slot-basis as in T1 mode, or it can be output on time slot 16 only via the RxSIGn output pins. In the latter case, signaling data (A,B,C,D) of channel 1 and channel 17 will be output on the RxSIGn pin during time slot 16 of frame 1, signaling data (A,B,C,D) of channel 2 and channel 18 will be output on the RxSIGn pin during time slot 16 of frame 2...etc. The CAS multiframe Alignments bits (0000 bits) and the extra bits/alarm bit (xyxx) will be output on the RxSIGn pin during time slot 16 of frame 0. ***NOTE:*** *Receive Fractional/signaling interface can be enabled by programming to bit 4 - RxFr1544/ RxFr2048 bit from register 0xn122 to '1'.*
RxSCLK0 RxSCLK1 RxSCLK2 RxSCLK3 RxSCLK4 RxSCLK5 RxSCLK6 RxSCLK7	C11 E14 A18 F17 W18 T14 U11 U8	B10 D12 A15 F12 T15 T11 P9 M7	O	8	**Receive Recovered Line Clock Output (RxSCLKn):** The exact function of these pins depends on whether or not the receive framer enables the receive fractional/signaling interface, as described below: **If receive fractional/signaling interface is disabled -** -No function **If receive fractional/signaling interface is enabled - Receive Recovered Line Clock Output (RxSCLKn):** These pins output the recovered T1/E1 line clock (1.544MHz in T1 mode and 2.048MHz in E1 mode) for each channel. ***NOTE:*** *Receive Fractional/Signaling interface can be enabled by programming to bit 4 - RxFr1544/ RxFr2048 bit from register 0xn122 to '1'.*

RECEIVE LINE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
RTIP0 RTIP1 RTIP2 RTIP3 RTIP4 RTIP5 RTIP6 RTIP7	C1 E1 H1 K1 M1 P1 T1 W2	B1 D1 F1 H1 K1 M1 P1 T2	I	-	**Receive Positive Analog Input (RTIPn):** RTIP is the positive differential input from the line interface. This input pin, along with the RRING input pin, functions as the “Receive DS1/E1 Line Signal” input for the XRT86VX38 device. The user is expected to connect this signal and the RRING input signal to a 1:1 transformer for proper operation. The center tap of the receive transformer should have a bypass capacitor of 0.1μF to ground (Chip Side) to improve long haul application receive capabilities.
RRING0 RRING1 RRING2 RRING3 RRING4 RRING5 RRING6 RRING7	D1 F1 J1 L1 N1 R1 U1 W3	C1 E1 G1 J1 L1 N1 R1 T3	I	-	**Receive Negative Analog Input (RRINGn):** RRING is the negative differential input from the line interface. This input pin, along with the RTIP input pin, functions as the “Receive DS1/E1 Line Signal” input for the XRT86VX38 device. The user is expected to connect this signal and the RTIP input signal to a 1:1 transformer for proper operation. The center tap of the receive transformer should have a bypass capacitor of 0.1μF to ground (Chip Side) to improve long haul application receive capabilities.
RxLOS0 RxLOS1 RxLOS2 RxLOS3 RxLOS4 RxLOS5 RxLOS6 RxLOS7	B8 B13 D15 E18 U19 U15 V11 V7	A7 C11 F11 D16 P16 P12 R10 P7	O	4	**Receive Loss of Signal Output Indicator (RLOSn):** The XRT86VX38 device will assert this output pin (i.e., toggle it “high”) anytime (and for the duration that) the Receive DS1/E1 Framer or LIU block declares the LOS defect condition. Conversely, the XRT86VX38 wil**l "TRI-State"** this pin anytime (and for the duration that) the Receive DS1/E1 Framer or LIU block is NOT declaring the LOS defect condition. ***NOTE:*** *Since the XRT86VX38 tri-states this output pin (anytime the channel is not declaring the LOS defect condition), the user MUST connect a "pull-down" resistor (ranging from 1K to 10K) to each RxLOS output pin, to pull this output pin to the logic "LOW" condition, whenever the Channel is NOT declaring the LOS defect condition.* This output pin will toggle “High” (declare LOS) if the Receive Framer or the Receive LIU block associated with Channel N determines that an RLOS condition occurs. In other words, this pin is OR-ed with the LIU RLOS and the Framer RLOS bit. If either the LIU RLOS or the Framer RLOS bit associated with channel N pulses high, the corresponding RLOS pin of that particular channel will be set to “High”.

RECEIVE LINE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
RxTSEL	B5	A5	I	-	**Receive Termination Control (RxTSEL):** Upon power up, the receivers are in "High" impedance. Switching to internal termination can be selected through the microprocessor interface by programming the appropriate channel register. However, to switch control to the hardware pin, RxTCNTL must be programmed to "1" in the appropriate global register (0x0FE2). Once control has been granted to the hardware pin, it must be pulled "High" to switch to internal termination. ***NOTE:*** *Internally pulled "Low" with a 50kΩ resistor.* **RxTSEL (pin)** / **Rx Termination** 0 / External 1 / Internal *Note: RxTCNTL (bit) must be set to "1"*

TRANSMIT LINE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	DESCRIPTION
TTIP0 TTIP1 TTIP2 TTIP3 TTIP4 TTIP5 TTIP6 TTIP7	D3 F3 H4 K4 L3 N3 R5 T3	C3 E3 G3 H3 J3 L3 M3 P3	O	**Transmit Positive Analog Output (TTIPn):** TTIP is the positive differential output to the line interface. This output pin, along with the corresponding TRING output pin, function as the Transmit DS1/E1 output signal drivers for the XRT86VX38 device. The user is expected to connect this signal and the corresponding TRING output signal to a 1:2 step up transformer for proper operation. This output pin will be tri-stated whenever the user sets the “TxON” input pin or register bit (0xnF02, bit 3) to “0”. ***NOTE:*** *This pin should have a series line capacitor of 0.68μF for DC blocking purposes.*
TRING0 TRING1 TRING2 TRING3 TRING4 TRING5 TRING6 TRING7	E3 F4 H3 K3 L4 N4 R4 U3	D3 E4 G4 H4 J4 L4 M4 P4	O	**Transmit Negative Analog Output (TRINGn):** TRING is the negative differential output to the line interface. This output pin, along with the corresponding TTIP output pin, function as the Transmit DS1/E1 output signal drivers for the XRT86VX38 device. The user is expected to connect this signal and the corresponding TRING output signal to a 1:2 step up transformer for proper operation. ***NOTE:*** *This output pin will be tri-stated whenever the user sets the “TxON” input pin or register bit (0xnF02, bit 3) to “0”.*

TRANSMIT LINE INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	DESCRIPTION
TxON	W4	T4	I	**Transmitter On** This input pin permits the user to either enable or disable the Transmit Output Driver within the Transmit DS1/E1 LIU Block. If the TxON pin is pulled "Low", all 8 Channels are tri-stated. When this pin is pulled 'High', turning on or off the transmitters will be determined by the appropriate channel registers (address 0x0Fn2, bit 3) **LOW** = Disables the Transmit Output Driver within the Transmit DS1/E1 LIU Block. In this setting, the TTIP and TRING output pins of all 8 channels will be tri-stated. **HIGH** = Enables the Transmit Output Driver within the Transmit DS1/E1 LIU Block. In this setting, the corresponding TTIP and TRING output pins will be enabled or disabled by programming the appropriate channel register. (address 0x0Fn2, bit 3) ***NOTE:*** *Whenever the transmitters are turned off, the TTIP and TRING output pins will be tri-stated.*

TIMING INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
MCLKIN	C8	E6	I	-	**Master Clock Input:** This pin is used to provide the timing reference for the internal master clock of the device. The frequency of this clock is programmable from 8kHz to 16.384MHz in register 0x0FE9.
E1OSCCLK	V5	R5	O	8	**Framer E1 Output Clock Reference** This output pin is defaulted to 2.048MHz, but can be programmed to 65.536MHz in register 0x011E.
T1OSCCLK	W5	T5	O	8	**Framer T1 Output Clock Reference** This output pin is defaulted to 1.544MHz, but can be programmed to output 49.408MHz in register 0x011E.
8KEXTOSC	T5	L6	I	-	**External Oscillator Select** For normal operation, this pin should not be used, or pulled "Low". This pin is internally pulled "Low" with a 50kΩ resistor.
ANALOG	E5	B4	O		**Factory Test Mode Pin** ***NOTE:*** *For Internal Use Only*

JTAG INTERFACE

The XRT86VX38 device's JTAG features comply with the IEEE 1149.1 standard. Please refer to the industry specification for additional information on boundary scan operations.

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
TCK	C10	D8	I	-	**Test clock: Boundary Scan Test clock input:** The TCLK signal is the clock for the TAP controller, and it generates the boundary scan data register clocking. The data on TMS and TDI is loaded on the positive edge of TCK. Data is observed at TDO on the falling edge of TCK.
TMS	B7	A6	I	-	**Test Mode Select:** Boundary Scan Test Mode Select input. The TMS signal controls the transitions of the TAP controller in conjunction with the rising edge of the test clock (TCK). ***NOTE:*** *For normal operation this pin must be pulled 'High'.*
TDI	A5	C8	I	-	**Test Data In:** Boundary Scan Test data input The TDI signal is the serial test data input. ***NOTE:*** *This pin is internally pulled 'high'.*
TDO	D7	B6	O	8	**Test Data Out:** Boundary Scan Test data output The TDO signal is the serial test data output.
TRST	C9	D7	I	-	**Test Reset Input:** The TRST signal (Active Low) asynchronously resets the TAP controller to the Test-Logic-Reset state. ***NOTE:*** *This pin is internally pulled 'high'*
aTEST	C7	C7	I	-	**Factory Test Mode Pin** ***NOTE:*** *This pin is internally pulled 'low', and should be pulled 'low' for normal operation.*

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
DATA0 DATA1 DATA2 DATA3 DATA4 DATA5 DATA6 DATA7	N16 P19 K16 L18 J19 H18 H16 G15	M14 L12 K12 J12 H13 G14 G12 G13	I/O	8	**Bidirectional Microprocessor Data Bus** These pins are used to drive and receive data over the bi-directional data bus, whenever the Microprocessor performs READ or WRITE operations with the Microprocessor Interface of the XRT86VX38 device. When DMA interface is enabled, these 8-bit bidirectional data bus is also used by the T1/E1 Framer or the external DMA Controller for storing and retrieving information.

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{REQ0}$	T19	N16	O	8	**DMA Cycle Request Output—DMA Controller 0 (Write)**: These output pins are used to indicate that DMA transfers (Write) are requested by the T1/E1 Framer. On the transmit side (i.e., To transmit data from external DMA controller to HDLC buffers within the XRT86VX38), DMA transfers are only requested when the transmit buffer status bits indicate that there is space for a complete message or cell. The DMA Write cycle starts by T1/E1 Framer asserting the DMA Request ($\overline{REQ0}$) 'low', then the external DMA controller should drive the DMA Acknowledge ($\overline{ACK0}$) 'low' to indicate that it is ready to start the transfer. The external DMA controller should place new data on the Microprocessor data bus each time the Write Signal is Strobed low if the $\overline{WR}$ is configured as a Write Strobe. If $\overline{WR}$ is configured as a direction signal, then the external DMA controller would place new data on the Microprocessor data bus each time the Read Signal ($\overline{RD}$) is Strobed low. The Framer asserts this output pin (toggles it "Low") when at least one of the Transmit HDLC buffers are empty and can receive one more HDLC message. The Framer negates this output pin (toggles it "High") when the HDLC buffer can no longer receive another HDLC message.
$\overline{REQ1}$	R16	R16	O	8	**DMA Cycle Request Output—DMA Controller 1 (Read):** These output pins are used to indicate that DMA transfers (Read) are requested by the T1/E1 Framer. On the receive side (i.e., To transmit data from HDLC buffers within the XRT86VX38 to external DMA Controller), DMA transfers are only requested when the receive buffer contains a complete message or cell. The DMA Read cycle starts by T1/E1 Framer asserting the DMA Request ($\overline{REQ1}$) 'low', then the external DMA controller should drive the DMA Acknowledge ($\overline{ACK1}$) 'low' to indicate that it is ready to receive the data. The T1/E1 Framer should place new data on the Microprocessor data bus each time the Read Signal is Strobed low if the $\overline{RD}$ is configured as a Read Strobe. If $\overline{RD}$ is configured as a direction signal, then the T1/E1 Framer would place new data on the Microprocessor data bus each time the Write Signal ($\overline{WR}$) is Strobed low. The Framer asserts this output pin (toggles it "Low") when one of the Receive HDLC buffer contains a complete HDLC message that needs to be read by the µC/µP. The Framer negates this output pin (toggles it "High") when the Receive HDLC buffers are depleted.

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{INT}$	J18	H15	O	8	**Interrupt Request Output:** This active-low output signal will be asserted when the XRT86VX38 device is requesting interrupt service from the Microprocessor. This output pin should typically be connected to the “Interrupt Request” input of the Microprocessor. The Framer will assert this active "Low" output (toggles it "Low"), to the local µP, anytime it requires interrupt service.
PCLK	P18	M16	I	-	**Microprocessor Clock Input:** This clock input signal is only used if the Microprocessor Interface has been configured to operate in the Synchronous Modes (e.g., Power PC 403 Mode). If the Microprocessor Interface is configured to operate in this mode, then it will use this clock signal to do the following. **1.** To sample the $\overline{CS}$, $\overline{WR}$/R/$\overline{W}$, A[14:0], D[7:0], $\overline{RD}$/$\overline{DS}$ and DBEN input pins, and **2.** To update the state of the D[7:0] and the RDY/DTACK output signals. ***NOTES:*** *1. The Microprocessor Interface can work with PCLK frequencies ranging up to 33MHz.* *2. This pin is inactive if the user has configured the Microprocessor Interface to operate in either the Intel-Asynchronous or the Motorola-Asynchronous Modes. In this case, the user should tie this pin to GND.* When DMA interface is enabled, the PCLK input pin is also used by the T1/E1 Framer to latch in or latch out receive or output data respectively.
PTYPE0 PTYPE1 PTYPE2	P17 N18 K19	M13 M12 H12	I	-	**Microprocessor Type Input:** These input pins permit the user to specify which type of Microprocessor/Microcontroller to be interfaced to the XRT86VX38 device. The following table presents the three different microprocessor types that the XRT86VX38 supports. **µPType2 / µPType1 / µPType0 / MICROPROCESSOR TYPE** 0 0 0 — 68HC11, 8051, 80C188 0 0 1 — MOTOROLA 68K 1 0 1 — IBM POWER PC 403 ***NOTE:*** *These pins are internally pulled “Low” with a 50kΩ resistor.*

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{\text{RDY}}$/$\overline{\text{DTACK}}$	M16	L16	O	12	**Ready/Data Transfer Acknowledge Output:** The exact behavior of this pin depends upon the type of Microprocessor/Microcontroller the XRT86VX38 has been configured to operate in, as defined by the PTYPE[2:0] pins. **Intel Asynchronous Mode - $\overline{\text{RDY}}$ - Ready Output** Tis output pin will function as the “active-low” READY output. During a READ or WRITE cycle, the Microprocessor Interface block will toggle this output pin to the logic low level, ONLY when the Microprocessor Interface is ready to complete or terminate the current READ or WRITE cycle. Once the Microprocessor has determined that this input pin has toggled to the logic “low” level, then it is now safe for it to move on and execute the next READ or WRITE cycle. If (during a READ or WRITE cycle) the Microprocessor Interface block is holding this output pin at a logic “high” level, then the Microprocessor is expected to extend this READ or WRITE cycle, until it detects this output pin being toggled to the logic low level. **Motorola Asynchronous Mode - $\overline{\text{DTACK}}$ - Data Transfer Acknowledge Output** Tis output pin will function as the “active-low” DTACK output. During a READ or WRITE cycle, the Microprocessor Interface block will toggle this output pin to the logic low level, ONLY when the Microprocessor Interface is ready to complete or terminate the current READ or WRITE cycle. Once the Microprocessor has determined that this input pin has toggled to the logic “low” level, then it is now safe for it to move on and execute the next READ or WRITE cycle. If (during a READ or WRITE cycle) the Microprocessor Interface block is holding this output pin at a logic “high” level, then the Microprocessor is expected to extend this READ or WRITE cycle, until it detects this output pin being toggled to the logic low level.

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{\text{RDY}}$/$\overline{\text{DTACK}}$	M16	L16	O	12	**(Con't)** **Power PC 403 Mode - RDY Ready Output:** This output pin will function as the "active-high" READY output. During a READ or WRITE cycle, the Microprocessor Interface block will toggle this output pin to the logic high level, ONLY when the Microprocessor Interface is ready to complete or terminate the current READ or WRITE cycle. Once the Microprocessor has sampled this signal being at the logic "high" level upon the rising edge of PCLK, then it is now safe for it to move on and execute the next READ or WRITE cycle. If (during a READ or WRITE cycle) the Microprocessor Interface block is holding this output pin at a logic "low" level, then the Microprocessor is expected to extend this READ or WRITE cycle, until it samples this output pin being at the logic low level. ***NOTE:*** *The Microprocessor Interface will update the state of this output pin upon the rising edge of PCLK.*
ADDR0 ADDR1 ADDR2 ADDR3 ADDR4 ADDR5 ADDR6 ADDR7 ADDR8 ADDR9 ADDR10 ADDR11 ADDR12 ADDR13 ADDR14	N19 M17 M18 M15 L16 M19 L17 L19 K15 J16 K18 J15 H15 H19 H17	L13 L14 K15 L11 K13 K16 K14 J15 J14 J13 H14 H16 G16 F16 G11	I	-	**Microprocessor Interface Address Bus Input** These pins permit the Microprocessor to identify on-chip registers and Buffer/Memory locations within the XRT86VX38 device whenever it performs READ and WRITE operations with the XRT86VX38 device. ***NOTE:*** *These pins are internally pulled "Low" with a 50kΩ resistor, except ADDR[8:14].*

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
ALE / $\overline{AS}$	K17	J16	I	-	**Address Latch Enable Input Address Strobe** The exact behavior of this pin depends upon the type of Microprocessor/Microcontroller the XRT86VX38 has been configured to operate in, as defined by the PTYPE[2:0] pins. **Intel-Asynchronous Mode - ALE** This active-high input pin is used to latch the address (present at the Microprocessor Interface Address Bus pins (A[14:0]) into the XRT86VX38 Microprocessor Interface block and to indicate the start of a READ or WRITE cycle. Pulling this input pin “high” enables the input bus drivers for the Address Bus input pins (A[14:0]). The contents of the Address Bus will be latched into the XRT86VX38 Microprocessor Interface circuitry, upon the falling edge of this input signal. **Motorola-Asynchronous (68K) Mode - $\overline{AS}$** This active-low input pin is used to latch the data residing on the Address Bus, A[14:0] into the Microprocessor Interface circuitry of the XRT86VX38 device. Pulling this input pin “low” enables the input bus drivers for the Address Bus input pins. The contents of the Address Bus will be latched into the Microprocessor Interface circuitry, upon the rising edge of this signal. **Power PC 403 Mode - No Function -Tie to GND:** This input pin has no role nor function and should be tied to GND.
$\overline{CS}$	G19	F14	I	-	**Microprocessor Interface—Chip Select Input:** The user must assert this active low signal in order to select the Microprocessor Interface for READ and WRITE operations between the Microprocessor and the XRT86VX38 on-chip registers and buffer/memory locations.

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{RD}$/$\overline{DS}$/$\overline{WE}$	N17	L15	I	-	**Microprocessor Interface—Read Strobe Input:** The exact behavior of this pin depends upon the type of Microprocessor/Microcontroller the Framer has been configured to operate in, as defined by the PTYPE[2:0] pins. **Intel-Asynchronous Mode - $\overline{RD}$ - READ Strobe Input:** This input pin will function as the **$\overline{RD}$** (Active Low Read Strobe) input signal from the Microprocessor. Once this active-low signal is asserted, then the XRT86VX38 device will place the contents of the addressed register (or buffer location) on the Microprocessor Interface Bi-directional data bus (D[7:0]). When this signal is negated, then the Data Bus will be tri-stated. **Motorola-Asynchronous (68K) Mode - $\overline{DS}$ - Data Strobe:** This input pin will function as the $\overline{DS}$ (Data Strobe) input signal. **Power PC 403 Mode - $\overline{WE}$ - Write Enable Input:** This input pin will function as the $\overline{WE}$ (Write Enable) input pin. Anytime the Microprocessor Interface samples this active-low input signal (along with $\overline{CS}$ and $\overline{WR}$/R/$\overline{W}$) also being asserted (at a logic low level) upon the rising edge of PCLK, then the Microprocessor Interface will (upon the very same rising edge of PCLK) latch the contents on the Bi-Directional Data Bus (D[7:0]) into the "target" on-chip register or buffer location within the XRT86VX38 device.
$\overline{WR}$ / R/$\overline{W}$	G17	F13	I	-	**Microprocessor Interface—Write Strobe Input** The exact behavior of this pin depends upon the type of Microprocessor/Microcontroller the XRT86VX38 has been configured to operate in, as defined by the PTYPE[2:0] pins. **Intel-Asynchronous Mode - $\overline{WR}$ - Write Strobe Input:** This input pin functions as the $\overline{WR}$ (Active Low WRITE Strobe) input signal from the Microprocessor. Once this active-low signal is asserted, then the input buffers (associated with the Bi-Directional Data Bus pin, D[7:0]) will be enabled. The Microprocessor Interface will latch the contents on the Bi-Directional Data Bus (into the "target" register or address location, within the XRT86VX38) upon the rising edge of this input pin. **Motorola-Asynchronous Mode - R/$\overline{W}$ - Read/Write Operation Identification Input Pin:** This pin is functionally equivalent to the "R/$\overline{W}$" input pin. In the Motorola Mode, a "READ" operation occurs if this pin is held at a logic "1", coincident to a falling edge of the RD/$\overline{DS}$ (Data Strobe) input pin. Similarly a WRITE operation occurs if this pin is at a logic "0", coincident to a falling edge of the RD/$\overline{DS}$ (Data Strobe) input pin.

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{WR}$ / R/$\overline{W}$	G17	F13	I	-	**(Con't)** **Power PC 403 Mode - R/$\overline{W}$ - Read/Write Operation Identification Input:** This input pin will function as the "Read/Write Operation Identification Input" pin. Anytime the Microprocessor Interface samples this input signal at a logic "High" (while also sampling the $\overline{CS}$ input pin "Low") upon the rising edge of PCLK, then the Microprocessor Interface will (upon the very same rising edge of PCLK) latch the contents of the Address Bus (A[14:0]) into the Microprocessor Interface circuitry, in preparation for this forthcoming READ operation. At some point (later in this READ operation) the Microprocessor will also assert the $\overline{DBEN/OE}$ input pin, and the Microprocessor Interface will then place the contents of the "target" register (or address location within the XRT86VX38 device) upon the Bi-Directional Data Bus pins (D[7:0]), where it can be read by the Microprocessor. Anytime the Microprocessor Interface samples this input signal at a logic "Low" (while also sampling the $\overline{CS}$ input pin a logic "Low") upon the rising edge of PCLK, then the Microprocessor Interface will (upon the very same rising edge of PCLK) latch the contents of the Address Bus (A[14:0]) into the Microprocessor Interface circuitry, in preparation for the forthcoming WRITE operation. At some point (later in this WRITE operation) the Microprocessor will also assert the $\overline{RD/DS/WE}$ input pin, and the Microprocessor Interface will then latch the contents of the Bi-Directional Data Bus (D[7:0]) into the contents of the "target" register or buffer location (within the XRT86VX38).

MICROPROCESSOR INTERFACE

SIGNAL NAME	329 PKG BALL#	256 PKG BALL #	TYPE	OUTPUT DRIVE (MA)	DESCRIPTION
$\overline{ACK0}$ $\overline{ACK1}$	T18 R19	N15 M15	I	-	**DMA Cycle Acknowledge Input—DMA Controller 0 (Write):** The external DMA Controller will assert this input pin "Low" when the following two conditions are met: **1.** After the DMA Controller, within the Framer has asserted (toggled "Low"), the Req_0 output signal. **2.** When the external DMA Controller is ready to transfer data from external memory to the selected Transmit HDLC buffer. At this point, the DMA transfer between the external memory and the selected Transmit HDLC buffer may begin. After completion of the DMA cycle, the external DMA Controller will negate this input pin after the DMA Controller within the Framer has negated the $\overline{Req\_0}$ output pin. The external DMA Controller must do this in order to acknowledge the end of the DMA cycle. **DMA Cycle Acknowledge Input—DMA Controller 1 (Read):** The external DMA Controller asserts this input pin "Low" when the following two conditions are met: **1.** After the DMA Controller, within the Framer has asserted (toggled "Low"), the Req_1 output signal. **2.** When the external DMA Controller is ready to transfer data from the selected Receive HDLC buffer to external memory. At this point, the DMA transfer between the selected Receive HDLC buffer and the external memory may begin. After completion of the DMA cycle, the external DMA Controller will negate this input pin after the DMA Controller within the Framer has negated the $\overline{Req\_1}$ output pin. The external DMA Controller will do this in order to acknowledge the end of the DMA cycle. ***NOTE:*** *This pin is internally pulled "High" with a 50kΩ resistor.*
$\overline{RESET}$	V4	R4	I	-	**Hardware Reset Input** $\overline{Reset}$ is an active low input. If this pin is pulled "Low" for more than 10μS, the device will be reset. When this occurs, all output will be 'tri-stated', and all internal registers will be reset to their default values.

NOTICE

EXAR Corporation reserves the right to make changes to the products contained in this publication in order to improve design, performance or reliability. EXAR Corporation assumes no responsibility for the use of any circuits described herein, conveys no license under any patent or other right, and makes no representation that the circuits are free of patent infringement. Charts and schedules contained here in are only for illustration purposes and may vary depending upon a user's specific application. While the information in this publication has been carefully checked; no responsibility, however, is assumed for inaccuracies.

EXAR Corporation does not recommend the use of any of its products in life support applications where the failure or malfunction of the product can reasonably be expected to cause failure of the life support system or to significantly affect its safety or effectiveness. Products are not authorized for use in such applications unless EXAR Corporation receives, in writing, assurances to its satisfaction that: (a) the risk of injury or damage has been minimized; (b) the user assumes all such risks; (c) potential liability of EXAR Corporation is adequately protected under the circumstances.

Datasheet June 2009.

REVISION HISTORY

REVISION #	DATE	DESCRIPTION
1.0.0	May. 01, 2009	Initial release of Hardware Description
1.0.1	June 16, 2009	Update packaging name to fpBGA, add BITS functionality to general description, updated features and applications and updates to eletrical tables
