OREB-80T15x RoHS Compliant PRELIMINARY Rev.A

Features

- Isolated
- High Efficiency
- Fixed Frequency (300 KHz)
- High Power Density
- Low Cost
- Class 2, Category 2, Isolated DC/DC Converter (refer to IPC-9592)
- Remote On/Off)
- Input Under Voltage Protection
- Output Over Voltage Protection
- OCP/SCP
- Over Temperature Protection

Applications

- Networking
- Computers and peripherals
- Telecommunications

Description

The OREB-80T15x is an isolated DC/DC converter that operates from a nominal 48 Vdc source. This converter provides up to 75W of output power. Features include remote on/off, short circuit protection, over current protection, over-temperature protection, output over-voltage protection, input under-voltage protection.

Part Selection

Output Trim Equations

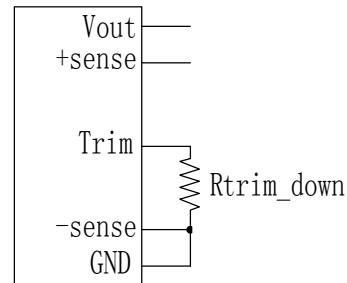

Equations for calculating the trim resistor are shown below. The Trim Down resistor should be connected between the Trim pin and Sense (-) pin. The Trim Up resistor should be connected between the Trim pin and the Sense (+). Only one of the resistors should be used for any given

Minimum trim down voltage is 12V

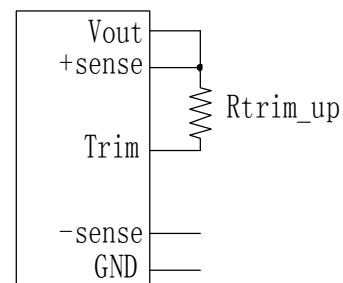

Maximum trim up voltage is 16.5V.

The total voltage increased by trim and remote sense should not exceed 10% of the nominal output voltage.

$$R_{trimdown} = \frac{511}{\Delta \%} - 10.2 [k\Omega]$$

$$R_{trimup} = \frac{5.11 \times V_o \times (100 + \Delta \%)}{1.225 \times \Delta \%} - \frac{510}{\Delta \%} - 10.2 [k\Omega]$$

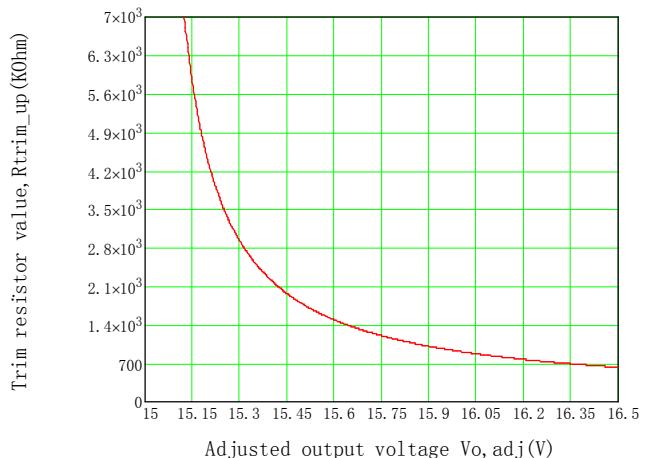

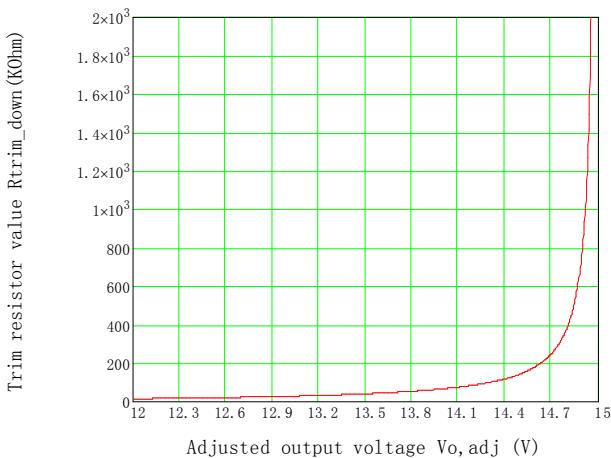

Note:

$$\Delta \% = \left| \frac{V_{DES} - V_o}{V_o} \right| \times 100$$

Vo_req=Desired (trimmed) output voltage [V]

Output voltage Vo=15.000 V

Remote Sense

This module has remote sense compensation feature. It can minimize the effects of resistance between module's output and load in system layout and facilitates accurate voltage regulation at load terminals or other selected point.

1. The remote sense lines carries very little current and hence do not require a large cross-sectional area.
2. This module compensates for a maximum drop of 10% of the nominal output voltage.
3. If the unit is already trimmed up, the available remote sense compensation range should be correspondingly reduced. The total voltage increased by trim and remote sense should not exceed 10% of the nominal output voltage.
4. When using remote sense compensation, all the resistance, parasitic inductance and capacitance of the system are incorporated within the feedback loop of this module. This can make an effect on the module's compensation, affecting the stability and dynamic response. A 0.1uF ceramic capacitor can be connected at the point of load to de-couple noise on the sense wires.
5. Recommend the connection of remote sense compensation as below figure. There are a resistor RS+ (51.1 ohm) from Vo+ to Sense+ and a resistor RS- (51.1 ohm)) from Vo- to Sense- inside of this module.

6. If not using remote sense compensation, please connect sense directly to output at module's pin, that is, connect sense+ to Vo+ and sense- to Vo- at module's pin, the shorter the better. See below figure.

Over Current Protection

To provide protection in a fault output overload condition, the module is equipped with internal current-limiting circuitry and can endure current limiting for a few milli-seconds. If the overcurrent condition persists beyond a few milliseconds, the module will shut down into hiccup mode and restart once every 500mS. The module operates normally when the output current goes into specified range. The typical average output current is 215mA during hiccup.

Over Voltage Protection

The output overvoltage protection consists of circuitry that monitors the voltage on the output terminals. If the voltage on the output terminals exceeds the over voltage protection threshold, the module will shutdown.

Thermal Derating Curve

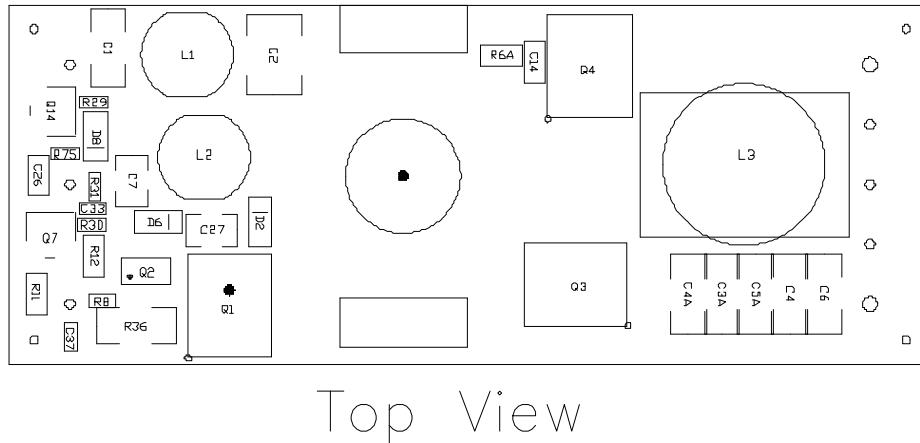

The OTP is achieved by thermistor R12 and the threshold is set at 125C in non-latch mode; the hottest component Q1 reaches 125C with 100LFM air flow correspondingly. It will restart automatically when the temperature falls down to 100C. The protecting point will be varied a little under different conditions (air flow, ambient temperature, input voltage, load...).

Maximum junction temperature of semiconductors derated to 120 degree C.
