

CYF2018V CYF2036V CYF2072V

18/36/72-Mbit Programmable Multi-Queue FIFOs

Features

- Memory organization
 - Industry's largest first in first out (FIFO) memory densities: 18-Mbit, 36-Mbit and 72-Mbit
 - □ Selectable memory organization: \times 9, \times 12, \times 16, \times 18, \times 20, \times 24, \times 32, \times 36
- Up to 100-MHz clock operation
- Unidirectional operation
- Independent read and write ports
 - Supports simultaneous read and write operations
 - Reads and writes operate on independent clocks, upto a maximum ratio of two, enabling data buffering across clock domains.
 - Supports multiple I/O voltage standard: Low voltage complementary metal oxide semiconductor (LVCMOS) 3.3 V and 1.8 V voltage standards.
- Input and output enable control for write mask and read skip operations
- User configured multi-queue operating mode upto 8-queues
- Mark and retransmit: resets read pointer to user marked position
- Empty and full flags
- Flow-through mailbox register to send data from input to output port, bypassing the FIFO sequence
- Separate serial clock (SCLK) input for serial programming
- Master reset to clear entire FIFO
- Joint test action group (JTAG) port provided for boundary scan function
- Industrial temperature range: -40 °C to +85 °C

Functional Description

The Cypress programmable FIFO family offers the industry's highest-density programmable FIFO memory device. It has independent read and write ports, which can be clocked up to 100 MHz. User can configure input and output bus sizes. The maximum bus size of 36 bits enables a maximum data throughput of 3.6 Gbps. The read and write ports can support multiple I/O voltage standards. The user-programmable registers enable user to configure the device operation as desired. The device also offers a simple and easy-to-use interface to reduce implementation and debugging efforts, improve time-to-market, and reduce engineering costs. This makes it an ideal memory choice for a wide range of applications including multiprocessor interfaces, video and image processing, networking and telecommunications, high-speed data acquisition, or any system that needs buffering at very high speeds across different clock domains.

As implied by the name, the functionality of the FIFO is such that the data is read out of the read port in the same sequence in which it was written into the write port. The data is sequentially written into the FIFO from the write port gets written into the device at the rising edge of the write clock. Enabling the reads and outputs fetches data on the read port at every rising edge of the read clock. Both reads and writes can occur simultaneously at different speeds provided the ratio of read to write clock is in the range of 0.5 to 2. Appropriate flags are set whenever the FIFO is empty or full.

The device also supports multi-queue operation upto 8 queues, mark and retransmit of data, and a flow-through mailbox register.

All product features and specs are common to all densities (CYF2072V, CYF2036V, and CYF2018V) unless otherwise specified. All descriptions are given assuming the device is CYF2072V operated in x 36 mode. They hold good for other densities (CYF2036V, and CYF2018V) and all port sizes x 9, x 12, x 16, x 18, x 20, x 24 and x 32 unless otherwise specified. The only difference will be in the input and output bus width. Table 1 on page 8 shows the part of bus with valid data from D[35:0] and Q[35:0] in x 9, x 12, x 16, x 18, x 20, x 24, x 32 and x 36 modes.

Figure 1. 209-ball FBGA (Top View)

Note 1. This pin should be tied to $V_{\mbox{SS}}$ preferably or can be left floating to ensure normal operation.

Pin Definitions

Q[35:0] Output Data outputs: Data outputs for a 36-bit bus. WEN Input Write enable: WEN enables WCLK to write data into the FIFO memory and configuration registers. REN Input Read enable: REN enables RCLK to read data from the FIFO memory and configuration registers. IFE Input enable: TE is the data input enable signal that controls the enabling and disabling of the 36-bit dat input prins. If it is enabled, data on the D[35:0] prins is written into the FIFO. The internal write address pointer is always incremented at rising edge of WCLK if WEN is enabled, regardless of the IE level. Thi is used for 'write masking' or incrementing the write pointer without writing into a location. OE Input Output enable: When OE is LOW, FIFO data outputs are enabled; when OE is HIGH, the FIFO's output are in High 2 (high impedance) state. WCLK Input Write clock: When enabled by WEN, the rising edge of WCLK writes data into the FIFO is bigh and into the configuration registers if LD is low. RCLK Input Read clock: When enabled by REN, the rising edge of RCLK reads data from the FIFO memory if LD i high and from the configuration registers if LD is low. EF Output Empty flag: When EF is LOW, the Queue is empty. EF is synchronized to RCLK. ID Input Read and the read pointer (read) into (from) the configuration registers. Whe LD is HIGH, D[35:0] (Q[35:0]) are written (read) into (from) the FIFO. RT	Pin Name	I/O	Pin Description
WERN Input Write enable: WEN enables WCLK to write data into the FIFO memory and configuration registers. REN Input Read enable: REN enables RCLK to read data from the FIFO memory and configuration registers. IE Input Input prives. If is enabled, data on the DI350 pins is written into the FIFO. The internal writte addres pointer is always incremented at rising edge of WCLK if WEN is enabled, regardless of the IE level. Thi is used for 'write masking' or incrementing the write pointer without writing into a location. OE Input Output enable: When OE is LOW, FIFO data outputs are enabled; when OE is HIGH, the FIFO's output are in High 2 (high impedance) state. WCLK Input Write clock: When enabled by WEN, the rising edge of WCLK writes data into the FIFO if D is high an into the configuration registers if LD is low. RCLK Input Read clock: When enabled by REN, the rising edge of RCLK reads data from the FIFO memory if D i high and from the configuration registers if LD is low. FF Output Full flag: When FF is LOW, the Queue is empty. EF is synchronized to RCLK. ID Input Loga: When FF is LOW, the Queue is empty. EF is synchronized to RCLK. ID Input Loga: When FF is LOW, the Queue is empty. EF is synchronized to RCLK. ID Input Loga: When FF is LOW, the Queue is empty. EF is synchronized to RCLK. ID	D[35:0]	Input	Data inputs: Data inputs for a 36-bit bus.
REN Input Read enable: REN enables RCLK to read data from the FIFO memory and configuration registers. IE Input Input enable: IE is the data input enable signal that controls the enabling and disabiling of the 36-bit dat input prise is witten into the PIFO. The internal write address incervented at rising edge of WCLK if WEN is enabled, registers. Pin Definitions (continued)

Pin Name	I/O	Pin Description
QVal[2:0]		Queue valid : Bus along with \overline{DVal} indicating the Queue for which data is being read out on Q[35:0] $\overline{DVal} = 0$ and QVal = 000 valid data read out from Queue-0 on Q[35:0] $\overline{DVal} = 0$ and QVal = 001 valid data read out from Queue-1 on Q[35:0] $\overline{DVal} = 0$ and QVal = 010 valid data read out from Queue-2 on Q[35:0] $\overline{DVal} = 0$ and QVal = 011 valid data read out from Queue-3 on Q[35:0] $\overline{DVal} = 0$ and QVal = 011 valid data read out from Queue-3 on Q[35:0] $\overline{DVal} = 0$ and QVal = 100 valid data read out from Queue-4 on Q[35:0] $\overline{DVal} = 0$ and QVal = 101 valid data read out from Queue-5 on Q[35:0] $\overline{DVal} = 0$ and QVal = 101 valid data read out from Queue-5 on Q[35:0] $\overline{DVal} = 0$ and QVal = 111 valid data read out from Queue-6 on Q[35:0] $\overline{DVal} = 0$ and QVal = 111 valid data read out from Queue-7 on Q[35:0]
PORTSZ [2:0]	Input	Port word size select: Port word width select pins (common for read and write ports).
V _{CC1}	Power Supply	Core voltage supply 1: 1.8 V supply voltage
V _{CC2}	Power Supply	Core voltage supply 2: 1.5 V supply voltage
V _{CCIO}	Power Supply	Supply for I/Os
V _{REF}	Input Reference	Reference voltage: Reference voltage (regardless of I/O standard used)
V _{SS}	Ground	Ground
DNU	_	Do not use: These pins need to be left floating.

Architecture

The CYF2072V, CYF2036V, and CYF2018V are of memory arrays of 72-Mbit, 36-Mbit, and 18-Mbit respectively. The memory organization is user configurable and word sizes can be selected as $\times 9$, $\times 12$, $\times 16$, $\times 18$, $\times 20$, $\times 24$, $\times 32$, or $\times 36$. The logic blocks to implement FIFO functionality and the associated features are built around these memory arrays.

The input and output data buses have a maximum width of 36 bits configurable through PORTSZ[2:0]. The input data bus goes to an input register and the data flow from the input register to the memory is controlled by the <u>write</u> logic block. The inputs to the write logic block are WCLK, WEN, IE, and WQSEL[2:0]. When the writes are enabled through WEN and if the inputs are enabled by IE, then the data on the input bus is written into the memory array at the rising edge of WCLK. This also increments the write pointer. Enabling writes but disabling the data input pins through IE only increments the write pointer without doing any writes or altering the contents of the location. WQSEL[2:0] selects the Queue in which the write should occur.

Similarly, the output register is connected to the data output bus. Transfer of contents from the memory to the output register is controlled by the read <u>control logic</u>. The inputs to the read control logic include RCLK, REN, OE, <u>RQSEL[2:0]</u>, MARK and RT. When reads are enabled by REN and outputs are enabled through OE, the data from the memory pointed by the read pointer is transferred to the <u>output</u> data bus at the rising edge of RCLK along with active low DVal. Qval[2:0] indicates the Queue number for which the read data belongs to. If the outputs are disabled but the reads enabled, the outputs are in high impedance state, but internally the read pointer is incremented. RQSEL[2:0] selects the Queue from which the read occurs. The MARK signal is used to 'mark' the location from which data is retransmitted when requested.

During write operation, the number of writes performed is always a even number (i.e., minimum write burst length is two and number of writes always a multiple of two). Whereas during read operation, the number of reads performed can be even or odd (i.e., minimum read burst length is one).

By default, the FIFO is accessed as a single Queue device. It is possible to divide the whole memory space into 2, 4 or 8 equal sized arrays. For more explanation please refer to Multi-Queue Operation on page 9.

Reset Logic

The Master Reset (MRS) initializes the read and write pointers to zero, sets the output registers to zero and sets the status of the flags to FF deasserted and EF asserted. MRS also resets the configuration register and the mark address to their default values. MRS configures the device into single Queue mode. A <u>MRS</u> is required after power up before accessing the FIFO. After MRS, a minimum latency of 1024 clocks is necessary before the first access. The word size is configured through pins; values of the three PORTSZ pins are latched on rising edge of MRS.After MRS, the device is configured in single Queue mode by default.

Flag Operation

This device provides two flag pins to indicate the condition of the FIFO contents.

Full Flag

The Full Flag (FF) goes LOW when the device is full. All write operations are inhibited whenever FF is LOW regardless of the state of WEN. FF is synchronized to WCLK, that is, it is exclusively updated by each rising edge of WCLK. The worst case assertion latency for Full Flag is four. As the user cannot know that the FIFO is full for four clock cycles, it is possible that user continues writing data during this time. In this case, the four data word written will be stored to prevent data loss and these words have to be read back in order for full flag to get de-asserted. In 2Q/4Q/8Q mode, FF indicates the status of the Queue selected by WQSEL[2:0]. The minimum number of reads required to de-assert full flag is six. The assertion and de-assertion of Full flag with associated latencies is explained in Latency Table on page 15.

Empty Flag

The Empty Flag (EF) goes LOW when the device is empty. All read operations are ignored whenever EF is LOW, regardless of the state of REN. EF is synchronized to RCLK, i.e., it is exclusively updated by each rising edge of RCLK. In 2Q/4Q/8Q mode, EF indicates the status of the Queue selected by RQSEL[2:0]. The assertion and de-assertion of empty flag with associated latencies is explained in Latency Table on page 15.

Retransmit from Mark Operation

The retransmit feature is useful for transferring packets of data repeatedly. It enables the receipt of data to be acknowledged by the receiver and retransmitted if necessary. The retransmit feature is used when the number of writes equal to or less than the depth of the FIFO has occurred – and at least one word has been read since the last reset cycle. A HIGH pulse on RT resets the internal read pointer to a physical location of the FIFO that is marked by the user (using the MARK pin). In multi-Queue mode the MARK and RT signals are validated with RQSEL[2:0], i.e., Mark or Retransmit function will be performed for the Queue that is selected by RQSEL[2:0]. With every valid read cycle after retransmit, previously accessed data is read and the read pointer is incremented until it is equal to the write pointer. Flags are governed by the relative locations of the read and write pointers and are updated during a retransmit cycle. Data written to FIFO after activation of RT are also transmitted. The full depth of the FIFO can be repeatedly retransmitted.

To mark a location, the Mark pin is asserted when reading that particular location.

Flow-through mailbox Register

This feature transfers data from input to output directly by bypassing the FIFO sequence. When MB signal is asserted the data present in D[35:0] will be available at Q[35:0] after two WCLK cycles. Normal read and write operations are not allowed during flow-through mailbox operation. Before starting Flow-through mailbo<u>x operation FIFO read should be completed</u> to make data valid (DVal) high in order to avoid data loss from FIFO. The width of flow-through mailbox register always corresponds to port size.

Selecting Word Sizes

The word sizes are configured based <u>on the</u> logic levels on the PORTSZ pins during the master reset (MRS) cycle only (latched

on low to high edge). The port size cannot be changed during normal mode of operation and these pins are ignored. If word size is less than \times 36, the unused output pins are tri-stated by the device.and unused input pins will be ignored by the internal logic. The pins with valid data input D[N:0] and output Q[N:0] is given in Table 1.

Data Valid Signal (DVal)

Data valid $(\overline{\text{DVal}})$ is an active low signal and is provided for easy capture of out<u>put data</u> to the user. When a read operation is performed, the DVal signal goes low along with output data. This helps user to capture the data without keeping track of REN to data output latency. This signal also helps when write and read operations are performed continuously at different frequencies by indicating when valid data is available at the output port Q[35:0].

Queue Valid Signal (QVal[2:0])

Queue Valid (Qval[2:0]) is a three bit output that indicates the Queue from which valid data is being read. With respect to data this bus has to be validated along with the DVal signal. when DVal signal is high, the values on this bus can be ignored.

Power Up

The device becomes functional after V_{CC1}, V_{CC2}, V_{CCI0}, and Vref attain minimum stable voltage required as given in Recommended DC Operating Conditions on page 14. The device can be accessed in t_{PU} time after these supplies attain the minimum required level

(see Switching Characteristics on page 17). There is no power sequencing required for the device.

Table 1.	Word	Size	Selection
----------	------	------	-----------

PORTSZ[2:0]	Word Size	Active input data pins D[X:0]	Active output data pins Q[X:0]
000	× 9	D[8:0]	Q[8:0]
001	× 12	D[11:0]	Q[11:0]
010	× 16	D[15:0]	Q[15:0]
011	× 18	D[17:0]	Q[17:0]
100	× 20	D[19:0]	Q[19:0]
101	× 24	D[23:0]	Q[23:0]
110	× 32	D[31:0]	Q[31:0]
111	× 36	D[35:0]	Q[35:0]

Table 2. Multi-Queue Configuration

Operating Mode (given by configuration register 0x3 [2:0])	RQSEL[2:0]/WQSEL[2:0]	Queue Number Selected
1Q mode	000	0
(register 0x3[2:0] = 3'b000)	001–111	Invalid

(register 0x3[2:0] = 3'b1XX)	001	1
	010	2
	011	3
	100	4
	101	5
	110	6
	111	7

Write Mask and Read Skip Operation

As mentioned in Architecture on page 7, enabling writes but disabling the inputs (\overline{IE} HIGH) increments the write pointer without doing any write operations or altering the contents of the location.

This feature is called Write Mask and allows user to move the write pointer without actually writing to the locations. This "write masking" ability is useful in some video applications such as Picture In Picture (PIP).

Similarly, d<u>uring</u> a read operation, if the outputs are disabled by having the OE high, the read data does not appear on the output bus; however, the read pointer is incremented.

Multi-Queue Operation

In general, the entire memory space is accessed as a single Fist In First Out (FIFO) order for the write and read operation. In this case, the entire memory space is called a single Queue. For example, for 72M device, the entire memory space is available as a single FIFO memory. In multi Queue mode, the entire memory space is divided into equal sized memory array and each individual memory array can be accessed as an independent FIFO based on additional control signals. These independent memory arrays are called as Queues. For example, when 72M device, is configured into eight Queue mode, the entire memory space of 72M is divided into eight 9M memory array called as Queue-0 to Queue-7. These Queues can be accessed independently as a FIFO by selecting the Queue select signals WQSEL[2:0] and RQSEL[2:0]. In this way, upto eight Queues can be created for a given device where data can be stored independently and read out independently.

It is possible to configure the whole memory space of CYF2072V into 8 or 4 or 2 equal sized array, and each array can be independently accessed as an independent FIFO. This is like having eight or four or two independent Queues inside the FIFO instead of entire memory space acting as single Queue FIFO. The number of Queues is configured based on the value of D2, D1 & D0 bit of configuration register 0x3 (refer to Table 3).

Table 2 on page 8 shows the value to be set in D2, D1 & D0 of configuration register 0x3 to configure the device in 1/2/4/8 Queue modes.

Table 3. Configuration Registers

ADDR	Configuration Register	Default	Bit [7]	Bit [6]	Bit [5]	Bit [4]	Bit [3]	Bit [2]	Bit [1]	Bit [0]

0	0	Х	1	Х	Х	Х	Illegal operation

Table 4. Writing and Reading Configuration Registers in Parallel Mode (continued)

Table 5	. Writing into	Configuration	Registers	in Serial Mode
---------	----------------	---------------	-----------	----------------

SPI_SEN	LD	WEN	REN	WCLK	RCLK	SCLK	Operation
0	1	Х	Х	Х	Х	↑ Rising edge	Each rising of the SCLK clocks in one bit from the SI (Serial In). Any of the 10 registers can be addressed and written to, following the SPI protocol.
Х	1	0	Х	↑ Rising edge	Х	Х	Parallel write to FIFO memory.
Х	1	Х	0	Х	↑ Rising edge	Х	Parallel read from FIFO memory.
1	0	1	1	Х	Х	Х	This corresponds to parallel mode (refer to Table 4).

Width Expansion Configuration

The width of CYF2072V can be expanded to provide word widths greater than 36 bits. During width expansion mode, all control line inputs are common and all flags are available. Empty (Full) flags are created by ANDing the Empty (Full) flags of every FIFO.

This technique avoids reading data from or writing data to the FIFO that is "staggered" by one clock cycle due to the variations in skew between RCLK and WCLK. Figure 3 demonstrates an example of a 72 bit-word width by using two 36-bit word CYF2072Vs.

Memory Organization for Different Port Sizes

The 72-Mbit memory has different organization for different port sizes. Table 6 shows the depth of the FIFO for all port sizes.

Note that for all port sizes, four to eight locations are not available for writing the data and are used to safeguard against false synchronization of empty and full flags.

Table 6. Word Size Selection

PORTSZ[2:0]	Word Size	FIFO Depth	Memory Size
000	× 9	8 Meg	72 Mbit
001	× 12	4 Meg	48 Mbit
010	× 16	4 Meg	64 Mbit
011	× 18	4 Meg	72 Mbit
100	× 20	2 Meg	40 Mbit
101	× 24	2 Meg	48 Mbit
110	× 32	2 Meg	64 Mbit
111	× 36	2 Meg	72 Mbit

The memory size mentioned is when the device is configured in single-Queue mode.

Read/Write Clock Requirements

The read and write clocks must satisfy the following requirements:

- Both read (RCLK) and write (WCLK) clocks should be free-running.
- The clock frequency for both clocks should be between the minimum and maximum range given in Switching Characteristics on page 17.

■ the ratio of RCLK to WCLK should be in the range of 0.5 to 2.

For proper FIFO operation, the device must determine which of the input clocks – RCLK or \underline{WCLK} – is faster. This is evaluated by using counters after the MRS cycle. The device uses two 10-bit counters inside (one running on RCLK and other on

WCLK), which count 1,024 cycles of read and write clock after MRS. The clock of the counter which reaches its terminal count first is used as master clock inside the FIFO.

When there is change in the relative frequency of RCLK and WCLK during normal operation of FIFO, user can specify it by using "Fast CLK bit" in the configuration register (0xA).

"1" - indicates f_{req} (WCLK) > f_{req} (RCLK)

"0" - indicates f_{req} (WCLK) < f_{req} (RCLK)

The result of counter evaluated frequency is available in this register bit. User can override the counter evaluated frequency for faster clock by changing this bit.

Whenever there is a change in this bit value, user must wait t_{PLL} time before issuing the next read or write to FIFO.

JTAG operation

CYF2XXXVXXL has two devices connected internally in a JTAG chain as shown in Figure 4.

Table 7 shows the IR register length and device ID.

Table 7. JTAG IDCODES

	IR Register length	Device ID (HEX)	Bypass register length
Device-1	3	"Ignore"	1
Device-2	8	1E3261CF	1

For boundary scan, device-1 should be in bypass mode.

Table 8 and Table 9 shows the JTAG instruction set for devices 1 and 2 respectively.

Table 8. JTAG Instructions

Device-1	Opcode (Binary)
BYPASS	111

Table 9. JTAG Instructions

Device-2	Opcode (HEX)
EXTEST	00
HIGHZ	07
SAMPLE/PRELOAD	01
BYPASS	FF

t _{WFF}	Write clock to FF	-	9.5	ns	
t _{REF}	Read clock to EF	-	9.5	ns	
t _{PLL}	Time required to synchronize PLL			1024	cycles
t _{RATE_JTAG}	JTAG TCK cycle time			-	ns
t _{S_JTAG}	Setup time for JTAG TMS,TDI			-	ns
t _{H_JTAG}	Hold time for JTAG TMS,TDI			-	ns
t _{CO_JTAG}	JTAG TCK low to TDO valid – 20				ns

Switching Waveforms

Acronyms

Acronym	Description	
EF	empty flag	
FF	full flag	
FIFO	first in first out	
ĪE	input enable	
I/O	input/output	
FBGA	fine-pitch ball grid array	
JTAG	joint test action group	
LVCMOS	low voltage complementary metal oxide semiconductor	
MB	mailbox	
MRS	master reset	
OE	output enable	
REN	read enable	
RCLK	read clock	
RQSEL	read queue select	
SCLK	serial clock	
TDI	test data in	
TDO	test data out	
ТСК	test clock	
TMS	test mode select	
WCLK	write clock	
WEN	write enable	
WQSEL	write queue select	
QUE-0	queue number 0	
QUE-1	queue number 1	

Document Conventions

Units of Measure

Symbol	Unit of Measure	
°C	degree Celsius	
MHz	megahertz	
μΑ	microampere	
mA	milliampere	
mm	millimeter	
ms	millisecond	
ns	nanosecond	
Ω	ohm	
pF	picofarad	
V	volt	
W	watt	

Document History Page

	Document Title: CYF2018V/CYF2036V/CYF2072V, 18/36/72-Mbit Programmable Multi-Queue FIFOs Document Number: 001-68336			
Rev.	ECN No.	Orig. of Change	Submission Date	Description of Change
**	3209860	SIVS	03/30/2011	New data sheet
*A	3353401	AJU	08/26/2011	Updated Package Diagram.
*В	3387127	AJU	09/28/2011	Updated Pin Diagram for CYF2XXXVXXL (Added Note 1 and referred the same note in DNU in ball U6). Updated Multi-Queue Operation (Updated Table 4 (WCLK column in first row)). Updated Recommended DC Operating Conditions (Added Note 2 and referred the same note in Parameter column). Updated Switching Waveforms (Removed the clock cycle numbers in Figure 10, Figure 14, Figure 15, Figure 16, and Figure 20).
*C	3652368	ADMU	08/16/2012	Updated Pin Diagram for CYF2XXXVXXL (Updated Figure 1 (W9 ball marked as DNU)). Updated Figure 5.

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at Cypress Locations.
