Functional Description[1]

The M24D16161DA is a high-performance CMOS Pseudo Static RAM organized as 1M words by 16 bits that supports an asynchronous memory interface. This device features advanced circuit design to provide ultra-low active current. This is ideal portable applications such as cellular telephones. The device can be put into standby mode when deselected ($\overline{CE1}$ HIGH or CE2 LOW or both $\overline{BHE}$ and $\overline{BLE}$ are HIGH). The input/output pins (I/O$_0$ through I/O$_{15}$) are placed in a high-impedance state when : deselected ($\overline{CE1}$ HIGH or

CE2 LOW), outputs are disabled ($\overline{OE}$ HIGH), both Byte High Enable and Byte Low Enable are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH), or during a write operation ($\overline{OE1}$ LOW and CE2 HIGH and $\overline{WE}$ LOW).

To write to the device, take Chip Enable ($\overline{CE1}$ LOW and CE2HIGH) and Write Enable ($\overline{WE}$) input LOW. If Byte Low Enable($\overline{BLE}$) is LOW, then data from I/O pins (I/O$_0$ through I/O$_7$), is written into the location specified on the address pins (A0through A$_{19}$). If Byte High Enable ($\overline{BHE}$) is LOW, then data from I/O pins (I/O$_8$ through I/O$_{15}$) is written into the location specified on the address pins (A$_0$ through A$_{19}$).

To read from the device, take Chip Enables ($\overline{CE1}$ LOW and CE2 HIGH) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins will appear on I/O0 to I/O7. If Byte High Enable ($\overline{BHE}$) is LOW, then data from memory will appear on I/O$_8$ to I/O$_{15}$.Refer to the truth table for a complete description of read and write modes.

Notes:
2. Ball H6 and E3 can be used to upgrade to a 32-Mbit and a 64-Mbit density, respectively.

Notes:
9. Test conditions for all parameters other than tri-state parameters assume signal transition time of 1 ns/V, timing reference levels of V$_{CC(typ.)}$/2, input pulse levels of 0V to V$_{CC}$, and output loading of the specified I$_{OL}$/I$_{OH}$ as shown in the "AC Test Loads and Waveforms" section.
10. At any given temperature and voltage conditions t$_{HZCE}$ is less than t$_{LZCE}$, t$_{HZBE}$ is less than t$_{LZBE}$, t$_{HZOE}$ is less than t$_{LZOE}$, and t$_{HZWE}$ is less than t$_{LZWE}$ for any given device. All low-Z parameters will be measured with a load capacitance of 30 pF (3V).
11. t$_{HZOE}$, t$_{HZCE}$, t$_{HZBE}$, and t$_{HZWE}$ transitions are measured when the outputs enter a high-impedance state.
12. High-Z and Low-Z parameters are characterized and are not 100% tested.
13 .If invalid address signals shorter than min. t$_{RC}$ are continuously repeated for 40 µs, the device needs a normal read timing (t$_{RC}$) or needs to enter standby state at least once in every 40 µs.
14. In order to achieve 70-ns performance, the read access must be Chip Enable ($\overline{CE1}$ or CE2) controlled. That is, the addresses must be stable prior to Chip Enable going active.

t_{LZWE}	$\overline{WE}$ HIGH to Low-Z[10, 11, 12]	10		ns

Note:

15. The internal Write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE1}$ = V_{IL} or CE2 = V_{IH}, $\overline{BHE}$ and/or $\overline{BLE}$ = V_{IL}. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write.

Switching Wave forms
Read Cycle 1 (Address Transition Controlled)[17, 18]
Read Cycle 2 ($\overline{OE}$ Controlled)[16, 18,19]
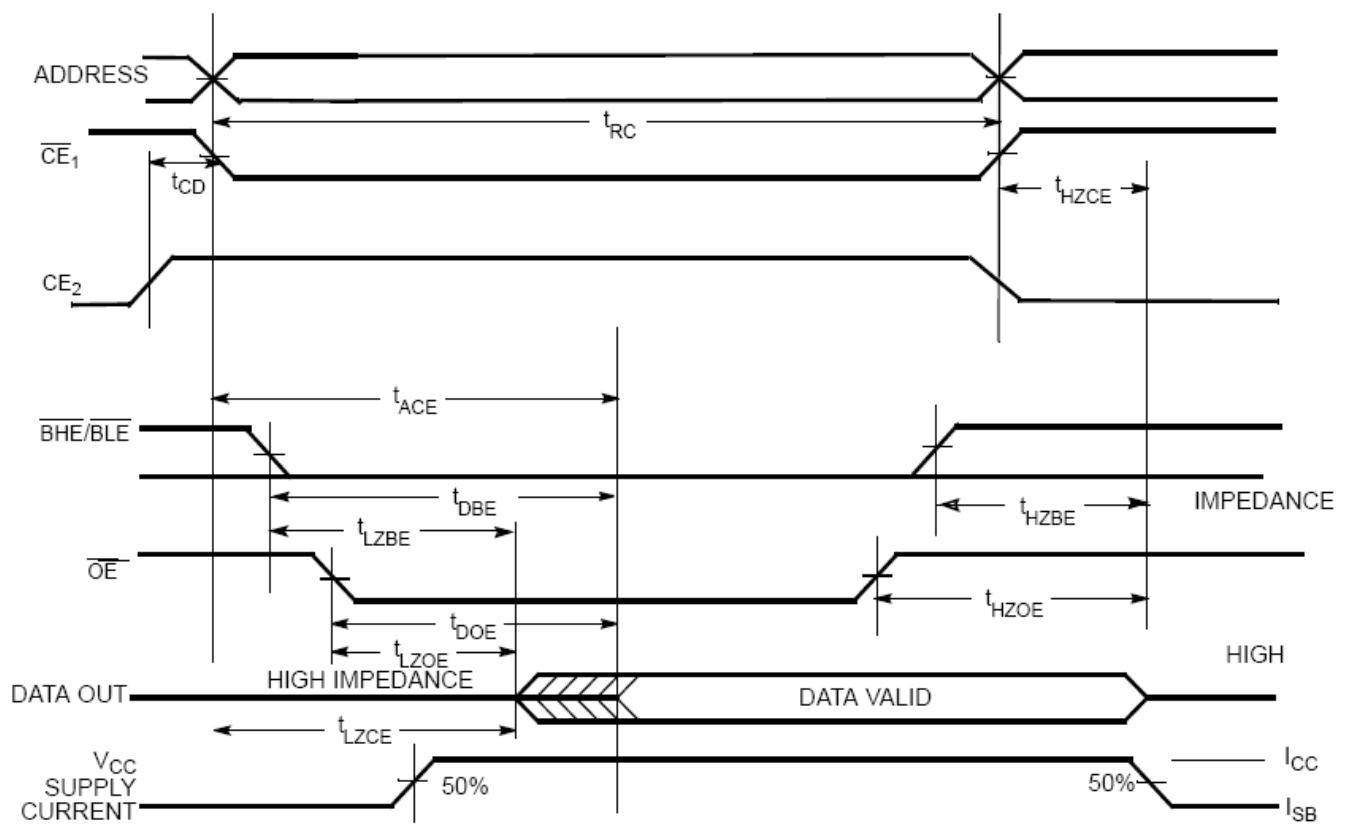

Notes:

16. Whenever $\overline{CE1}$ = HIGH or CE2 = LOW, $\overline{BHE}/\overline{BLE}$ are taken inactive, they must remain inactive for a minimum of 5 ns.

17. Device is continuously selected. $\overline{OE}$ = $\overline{CE1}$ = V_{IL} and CE2 = V_{IH}.

18. $\overline{WE}$ is HIGH for Read Cycle.

19. $\overline{CE}$ is the Logical AND of $\overline{CE1}$ and CE2.

Switching Waveforms (continued)

Notes:

20. Data I/O is high-impedance if $\overline{OE} \geq V_{IH}$.

21. During the DON'T CARE period in the DATA I/O waveform, the I/Os are in output state and input signals should not be applied.
