Application Circuits

1. Normal hard reset

Delay time (tpLH)

$$\approx C_L \times R_L \times \left[\ln \frac{V_{CC}}{V_{CC} - (V_s \text{ cpu} + 0.2)} \right] + 0.025(\text{mS})$$

C_L : μF · $V_s \text{ cpu}$: Reset threshold voltage of CPU, MPU, etc.

R_L : $\text{k}\Omega$

Voltage: V

Note: Connect a capacitor between IC pins 1 and 2 if V_{CC} line impedance is high.

2. Manual reset added

Note 1: Use R_L , C_L and R_m to prevent manual switch chattering. Note that R_m should be set to the following conditions.

$$R_m \leq 1/20R_L$$

Note 2: Connect a capacitor between IC pins 1 and 2 if V_{CC} line impedance is high.

3. Battery checker (LED ON for high voltage)

Note: Connect a capacitor between IC pins 1 and 2 if Vcc line impedance is high.

4. Battery checker (LED ON for low voltage)

Note: Connect a capacitor between IC pins 1 and 2 if Vcc line impedance is high.

5. Hysteresis voltage UP method

When increasing hysteresis voltage for stable system operation, determine RH as follows and connect externally.

However, I_{ccH} is $-5000\text{PPM}/^\circ\text{C}$ so perform temperature compensation at RH when using over a wide temperature range.

Hysteresis voltage UP amount (ΔV_{sup}) is

$$\Delta V_{sup} \approx R_H \cdot I_{ccL}$$

Total hysteresis voltage (ΔV_{total}) is

$$\Delta V_{total} \approx V_s + \Delta V_{sup}$$

Note: Connect a capacitor between IC pins 1 and 2 if Vcc line impedance is high.
