FAN48632 2.5 MHz, 2.0 A Pulsed-Load Synchronous TinyBoost™ Regulator with Bypass Mode for GSM PA Supply

Features

- Few External Components: 0.47 µH Inductor and 0603 Case Size Input and Output Capacitors
- Input Voltage Range: 2.35 V to 5.5 V
- Fixed Output Voltage : 3.3 V, 3.5 V
- Maximum Continuous Load Current of: 1.5 A at V_{IN} of 2.6 V
- Maximum Pulsed Load current :of 2.0 A for GSM 217 Hz repetition rate ,boosting V_{OUT} to 3.3 V or 3.5 V
- Up to 96% Efficient
- True Bypass Operation when V_{IN} > Target V_{OUT}
- Internal Synchronous Rectifier
- Soft-Start with True Load Disconnect
- Forced Bypass Mode
- V_{SEL} Control to Optimize Target V_{OUT}
- Short-Circuit Protection
- Low Operating Quiescent Current
- 16-Bump, 0.4 mm Pitch WLCSP

Applications

- Boost for Low-Voltage Li-ion Batteries, Brownout Prevention, Supply GSM RF PA.
- Cell Phones, Smart Phones, Tablets

Description

The FAN48632 allows systems to take advantage of new battery chemistries that can supply significant energy when the battery voltage is lower than the required voltage for system power ICs. By combining built-in power transistors, synchronous rectification, and low supply current; this IC provides a compact solution for systems using advanced Li-lon battery chemistries.

The FAN48632 is a boost regulator designed to provide a minimum output voltage (V_{OUT(MIN)}) from a single-cell Li-Ion battery, even when the battery voltage is below system minimum. In boost mode, output voltage regulation is guaranteed to a maximum load current of 1.5 A continuous and 2.0 A pulsed. Quiescent current in Shutdown Mode is less than 3 μ A, which maximizes battery life. The regulator transitions smoothly between Bypass and normal Boost Mode. The device can be forced into Bypass Mode to reduce quiescent current.

The FAN48632 is available in a 16-bump, 0.4 mm pitch, Wafer-Level Chip-Scale Package (WLCSP).

Pin Definitions

Pin #	Name	Description			
A1	EN	Enable. When this pin is HIGH, the circuit is enabled. ⁽²⁾			
A2	PG	Power Good . This is an open-drain output. PG is actively pulled LOW if output falls out of regulation due to overload or if thermal protection threshold is exceeded.			
A3–A4	VIN	Input Voltage. Connect to Li-Ion battery input power source. ⁽²⁾			
B1	VSEL	Output Voltage Select. When boost is running, this pin can be used to select output voltage.			
B2, C2 D1	AGND	Analog Ground . This is the signal ground reference for the IC. All voltage levels are measured with respect to this pin.			
B3–B4	VOUT	Output Voltage. Place C _{OUT} as close as possible to the device.			
C1	BYP	Bypass . This pin can be used to activate Forced Bypass Mode. When this pin is LOW, the bypass switches (Q3 and Q1) are turned on and the IC is otherwise inactive.			
C3–C4	SW	Switching Node. Connect to inductor.			
D2–D4	PGND	Power Ground . This is the power return for the IC. The C_{OUT} bypass capacitor should be returned with the shortest path possible to these pins.			

Note:

2. The EN pin can be tied to VIN, but it is recommended to tie EN to the 1.8 V logic voltage.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol		Parameter	Min.	Max.	Unit
V _{IN}	V _{IN} Input Voltage	V _{IN} Input Voltage			V
Vout	Vout Output Voltage			6.0	V

T _{STG}	Storage Temperature		-65	+150	°C
TL	Lead Soldering Temperatur	e, 10 Seconds		+260	°C

Note:

3. Lesser of 6.5 V or V_{IN} + 0.3 V.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter	Min.	Max.	Unit
V _{IN}	Supply Voltage	2.35	5.50	V
IOUT	Output Current	0	1500	mA
T _A	Ambient Temperature	-40	+85	°C
TJ	Junction Temperature	-40	+125	°C

Thermal Properties

Junction-to-ambient thermal resistance is a function of application and board layout. This data is measured with four-layer Fairchild evaluation boards (1 oz copper on all layers). Special attention must be paid not to exceed junction temperature $T_{J(max)}$ at a given ambient temperate T_A .

Symbol	Parameter 1		Unit
θ_{JA}	Junction-to-Ambient Thermal Resistance	80	°C/W
θ_{JB}	Junction-to-Board Thermal Resistance	42	C/W

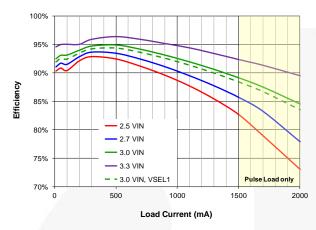

Electrical Specifications

Recommended operating conditions, unless otherwise noted, circuit per Figure 1, $V_{IN} = 2.35 \text{ V}$ to V_{OUT} , $T_A = -40^{\circ}\text{C}$ to 85°C . Typical values are given $V_{IN} = 3.0 \text{ V}$ and $T_A = 25^{\circ}\text{C}$.

Circuit Description

FAN48632 is a synchronous boost regulator, typically operating at 2.5 MHz in Continuous Conduction Mode (CCM), which occurs at moderate to heavy load current and low V_{IN} voltages. The regulator includes a Bypass Mode that activates when V_{IN} is above the boost regulator's set point.

In anticipation of a heavy load transition, the set point can be adjusted upward by fixed amounts with the VSEL pin to reduce the required system headroom during lighter-load operation to save power.

Table 2. Operating States

Mode	Description	Invoked When
LIN	Linear Startup	V _{IN} > V _{OUT}
SS	Boost Soft-Start	$V_{OUT} < V_{OUT(MIN)}$
BST	Boost Operating Mode	$V_{OUT} = V_{OUT(MIN)}$
BPS	True Bypass Mode	$V_{\rm IN} > V_{\rm OUT(MIN)}$

Boost Mode

The FAN48632 uses a current-mode modulator to achieve excellent transient response and smooth transitions between CCM and Discontinuous Conduction Mode (DCM) operation. During CCM operation, the device maintains a switching frequency of about 2.5 MHz. In light-load operation (DCM), frequency is reduced to maintain high efficiency.

Table 5. Boost Startup Sequence					
Start State	Entry	Exit	End State	Timeout (µs)	
LIN1	V _{IN} > UVLO, EN=1	V _{OUT} > V _{IN} - 300 mV	SS		
			LIN2	512	
LIN2	LIN1 Exit	V _{OUT} > V _{IN} - 300 mV	SS		
		TIMEOUT	FAULT	1024	
SS	LIN1 or LIN2 Exit	V _{OUT} =V _{OUT(MIN)}	BST		
		OVERLOAD TIMEOUT	FAULT	64	

Table 3. Boost Startup Sequence

Shutdown and Startup

If EN is LOW, all bias circuits are off and the regulator is in Shutdown Mode. During shutdown, current flow is prevented from $V_{\rm IN}$ to $V_{\rm OUT}$, as well as reverse flow from $V_{\rm OUT}$ to $V_{\rm IN}$. During startup, it is recommended to keep DC current draw below 500 mA.

LIN State

When EN is HIGH and V_{IN} > UVLO, the regulator attempts to bring V_{OUT} within 300 mV of V_{IN} using the internal fixed current source from V_{IN} (Q3). The current is limited to LIN1 set point.

If V_{OUT} reaches $V_{\text{IN}}\text{-}300$ mV during LIN1 Mode, the SS state is initiated. Otherwise, LIN1 times out after 512 μs and LIN2 Mode is entered.

In LIN2 Mode, the current source is incremented to 2 A. If V_{OUT} fails to reach $V_{\text{IN}}\text{-}300$ mV after 1024 $\mu\text{s},$ a fault condition is declared.

SS State

Upon the successful completion of the LIN state ($V_{OUT} \ge V_{IN}$ -300 mV), the regulator begins switching with boost pulses current limited to 50% of nominal level.

During SS state, V_{OUT} is ramped up by stepping the internal reference. If V_{OUT} fails to reach regulation during the SS ramp sequence for more than 64 µs, a fault condition is declared. If large C_{OUT} is used, the reference is automatically stepped slower to avoid excessive input current draw.

BST State

This is a normal operating state of the regulator.

BPS State

If V_{IN} is above V_{REG} when the SS Mode successfully completes, the device transitions directly to BPS Mode.

FAULT State

The regulator enters the FAULT state under any of the following conditions:

- V_{OUT} fails to achieve the voltage required to advance from LIN state to SS state.
- V_{OUT} fails to achieve the voltage required to advance from SS state to BST state.
- Boost current limit triggers for 2 ms during the BST state.
- V_{DS} protection threshold is exceeded during BPS state.

Once a fault is triggered, the regulator stops switching and presents a high-impedance path between V_{IN} and V_{OUT} . After waiting 20 ms, a restart is attempted.

Power Good

Power good is 0 FAULT, 1 POWER GOOD, open-drain input.

The Power good pin is provided for signaling the system when the regulator has successfully completed soft-start and no faults have occurred. Power good also functions as an early warning flag for high die temperature and overload conditions.

- PG is released HIGH when the soft-start sequence is successfully completed.
- PG is pulled LOW when PMOS current limit has triggered for 64 µs OR the die the temperature exceeds 120°C. PG is re-asserted when the device cools below to 100°C.
- Any FAULT condition causes PG to be de-asserted.

Over-Temperature

The regulator shuts down when the die temperature exceeds 150°C. Restart occurs when the IC has cooled by approximately 20°C.

Bypass Operation

In normal operation, the device automatically transitions from Boost Mode to Bypass Mode, if V_{IN} goes above target V_{OUT}. In Bypass Mode, the device fully enhances both Q1 and Q3 to provide a very low impedance path from V_{IN} to V_{OUT}. Entry to the Bypass Mode is triggered by condition where V_{IN} > V_{OUT} and no switching has occurred during past 5 µs. To soften the entry to Bypass Mode, Q3 is driven as a linear current source for the first 5 µs. Bypass Mode exit is triggered when V_{OUT} reaches the target V_{OUT} voltage. During Automatic Bypass Mode, the device is short-circuit protected by voltage comparator tracking the voltage drop from V_{IN} to V_{OUT}; if the drop exceeds 200 mV, a FAULT is declared.

With sufficient load to enforce CCM operation, the Bypass Mode to Boost Mode transition occurs at the target V_{OUT} . The corresponding input voltage at the transition point is:

$$V_{IN} \leq V_{OUT} + I_{LOAD} \bullet (DCR_L + R_{DS(ON)P}) \parallel R_{DS(ON)BYP}$$
EQ.

The Bypass Mode entry threshold has 25 mV hysteresis imposed at VOUT to prevent cycling between modes. The transition from Boost Mode to Bypass Mode occurs at the target V_{OUT}+25 mV. The corresponding input voltage is:

$$V_{IN} \ge V_{OUT} + 25mV + I_{LOAD} \bullet (DCR_L + R_{DS(ON)P})$$
 EQ. 2

Forced Bypass

Entry to Forced Bypass Mode initiates with a current limit on Q3 and then proceeds to a true bypass state. To prevent reverse current to the battery, the device waits until output discharges below $V_{\rm IN}$ before entering Forced Bypass Mode.

Low-I_Q Forced Bypass Mode is available for the FAN48632. After the transition is complete, most of the internal circuitry is disabled to minimize quiescent current draw. OCP, UVLO, output OVP and over-temperature protections are inactive in Forced Bypass Mode.

In Forced Bypass Mode, VOUT can follow VIN below VOUT(MIN).

VSEL

 V_{SEL} can be asserted in anticipation of a positive load transient. Raising V_{SEL} increases $V_{\text{OUT}(\text{MIN})}$ by a fixed amount and V_{OUT} is stepped to the corresponding target output voltage in 20 μs . The functionality can also be utilized to mitigate undershoot during severe line transients, while minimizing V_{OUT} during more benign operating conditions to save power.

Application Information

Output Capacitance (COUT)

Stability

The effective capacitance (C_{EFF}) of small, high-value, ceramic capacitors decreases as bias voltage increases.

FAN48632 is guaranteed for stable operation with the minimum value of C_{EFF} (C_{EFF(MIN)}) of 14 $\mu F.$

C_{EFF} varies with manufacturer, material, and case size.

Inductor Selection

The recommended nominal inductance value is 0.47 μ H.

FAN48632 employs valley-current limiting; peak inductor current can exceed4.4 A for a short duration during overload conditions. Saturation effects cause the inductor current ripple to become higher under high loading as only valley of the inductor current ripple is controlled..

Startup

Input current limiting is in effect during soft-start, which limits the current available to charge C_{OUT} and any additional capacitance on the V_{OUT} line. If the output fails to achieve regulation within the limits described in the Startup section, a FAULT occurs, causing the circuit to shut down then restart after a significant time period. If the total combined output capacitance is very high, the circuit may not start on the first attempt, but eventually achieves regulation if no load is present. If a high-current load and high capacitance are both present during soft-start, the circuit may fail to achieve regulation and continually attempts soft-start, only to have the output capacitance discharged by the load when in a FAULT state.

Output Voltage Ripple

Output voltage ripple is inversely proportional to C_{OUT} . During t_{ON} , when the boost switch is on, all load current is supplied by C_{OUT} . Output ripple is calculated as:

$$V_{RIPPLE (P-P)} = t_{ON} \bullet \frac{I_{LOAD}}{C_{OUT}}$$
 EQ. 3

and

$$t_{ON} = t_{SW} \bullet D = t_{SW} \bullet \left(1 - \frac{V_{IN}}{V_{OUT}}\right)$$
EQ. 4

therefore:

$$V_{RIPPLE(P-P)} = t_{SW} \bullet \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \bullet \frac{I_{LOAD}}{C_{OUT}} \qquad EQ.5$$

and

$$t_{SW} = \frac{1}{f_{SW}}$$
 EQ. 6

As can be seen from EQ. 5, the maximum V_{RIPPLE} occurs when V_{IN} is at minimum and I_{LOAD} is at maximum.

2.0 A Pulsed Loads for GSM Applications

The FAN48632 can support 2 A load pulses for GSM and GSM Edge applications, according to the minimum V_{IN} levels shown in Figure 23.

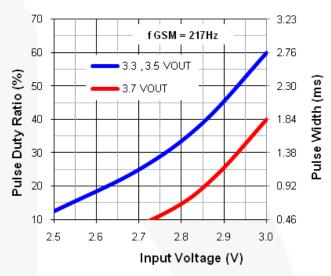

Figure 23. Minimum V_{IN} for 2 A GSM Pulse, 3.5 V_{OUT}

Results shown use circuit/components of Figure 1 with device mounted on standard evaluation platform (layout Figure 24).

Layout Recommendation

To minimize spikes at V_{OUT} , C_{OUT} must be placed as close as possible to PGND and VOUT, as shown in Figure 24. The associated PGND and V_{OUT} routes are best made directly on the top copper layer, rather than thru vias.

For thermal reasons, it is suggested to maximize the pour area for all planes other than SW. Especially the ground pour should be set to fill all available PCB surface area and tied to internal layers with a cluster of thermal vias.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

- Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
- A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all waranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty overage or other assistance for parts bought from Unauthorized Surces. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
